2007 SUMMARY

This is the twentieth year that the Tualatin River Flow Management Technical Committee has prepared an annual report documenting the flow management of the Tualatin River. Members of the committee include Clean Water Services (CWS), Tualatin Valley Irrigation District (TVID), Joint Water Commission (JWC), Lake Oswego Corporation (LOC) and Oregon Water Resources Department (OWRD).

Highlights for 2007 include:

- Low rainfall in January and low flow in February resulted in starting the reservoir fill process earlier than normal

Tualatin River at Farmington (RM 33.3 #14206500) 1989–2007

- Both Barney and Scoggins Reservoirs filled.
- The minimum flow released from Scoggins Reservoir into Scoggins Creek was voluntarily increased from 10 cfs to 25 cfs for the benefit of coho redds.
- Data updates were increased to hourly intervals for seven OWRD sites that are served by the GOES satellite system.
- The comprehensive Hagg Lake monitoring program that was initiated in August 1999 was discontinued in 2007. An assessment of macroinvertebrates was done in October of 2007. The results are in Appendix G.
- JWC developed a monitoring plan for Barney Reservoir which will be implemented beginning in 2008.
- A large storm occurred during the first week of December which flooded several areas in the basin. This event is described in more detail on the next page.

December storm event

- From December 1st until December 4th, 6.71 inches of rain fell at Scoggins Reservoir; Saddle Mountain, in the upper elevations of the basin, received 11.0 inches of rain in the same time period.
- Storage at Barney and Scoggins Reservoirs drastically increased.

Reservoir	Time Period	Reservoir Elevation Gain (feet)	Storage Gain (acre-feet)
Barney Reservoir	11/30/2007 – 12/4/2007	7	2,437
Scoggins Reservoir	11/30/2007 – 12/5/2007	13.4	10,229

- Inflow to Scoggins Reservoir rose so quickly and carried so much debris and silt that gaging sites on all three inflow streams (Sain, Scoggins, and Tanner Creeks) were damaged. The velocity of the water destroyed each control point. Huge boulders were moved out of position leaving some intake pipes exposed. Tanner Creek was completely silted in.
- The amount of debris that entered Hagg Lake matched or exceeded the amount received in the flood of February 1996 and the lake immediately became turbid.
- The Cherry Grove Slow Sand Plant and Forest Grove's Water Treatment Plant were closed for over a week due to the increased turbidity resulting from the flooding conditions and several upstream landslides.
- The Joint Water Commission Water Treatment Plant continued to produce high quality drinking water even though the turbidity levels exceeded 800 NTU for several days.
- Low lying areas around the City of Gaston experienced higher than usual flooding. Pressure from the flood water on the outside of the dike surrounding Wapato Lake caused the dike to break. This immediately stemmed the rise of the Tualatin River and water levels began to decrease as the excess water filled the lake.
- This event was unique in that it came so early in the season and in that the floodwaters rose and receded very quickly.

A landslide on Lee Falls Road. December 3, 2007
Jennifer Gay, Water Department City of Hillsboro

High turbidity in the upper Tualatin River is evident at the logging bridge near Lee Falls. December 3, 2007
Jennifer Gay,
Water Department City of Hillsboro

BACKGROUND

Basin Description

The Tualatin River Basin comprises an area of 712 square miles situated in the northwest corner of Oregon and is a subbasin of the Willamette River. The headwaters are in the Coast Range and flow in a generally easterly direction to the confluence with the Willamette River. The basin lies almost entirely in Washington County. (See map below)

The Tualatin River is about 80 miles long and changes dramatically from its headwaters to its mouth. The mountain or headwater reach (upstream of RM 55) is narrow (about 15 ft) and steep with an average slope of about 74 ft/mi. The meander reach (RM 55–33) is wider with an average slope of about 1.3 ft/mi. The reservoir reach (RM 33–3.4) is very wide (up to 150 ft) and has an estimated slope of only 0.08 ft/mi. It includes several deep pools. Travel times through this reach are very long. The slow movement of the water causes this reach to act much like a lake. In the riffle reach (RM 3.4–0), the Tualatin River flows through a short reservoir section and then drops into a narrow gorge near the City of West Linn before it enters the Willamette River just upstream of Willamette Falls. The average slope in this reach is 10 ft/mi.

Water sources to the Tualatin River

Precipitation: Seasonal rainfall accounts for most of the natural flow in the Tualatin Basin; stream flow from snowmelt is minimal. The amount of rainfall ranges from 110 inches on the eastern slopes of the Coast Range to 37 inches in the southeastern area of the drainage basin. Peak months for rainfall are November through February while the driest months are normally June through October. The peak streamflow month is usually February, and the lowest streamflow month is August.

Barney Reservoir: Barney Reservoir is located on the Middle Fork of the North Fork of the Trask River. It has a capacity 20,000 acre-feet and stores water for Clean Water Services, the Tualatin Valley Water District, and the Cities of Beaverton, Hillsboro and Forest Grove. Water released from Barney Reservoir enters the Tualatin River at RM 78 via an aqueduct over a low Coast Range divide and via a pipeline. Water is released during the summer low-flow season to supplement shortages in natural flow.

Scoggins Reservoir: Scoggins Creek enters the Tualatin River at RM 60.0. In the early 1970's the Bureau of Reclamation built an earthen dam on Scoggins Creek. Scoggins reservoir (Henry Hagg Lake) has an active storage capacity of 53,640 acre-feet. It is a multipurpose facility with contracted water for irrigation, municipal and industrial, and water quality uses. Recreation is a major activity during the summer months on the reservoir. During the winter it serves as a flood control structure with 20,000 acre feet designated for flood control storage from November to April.

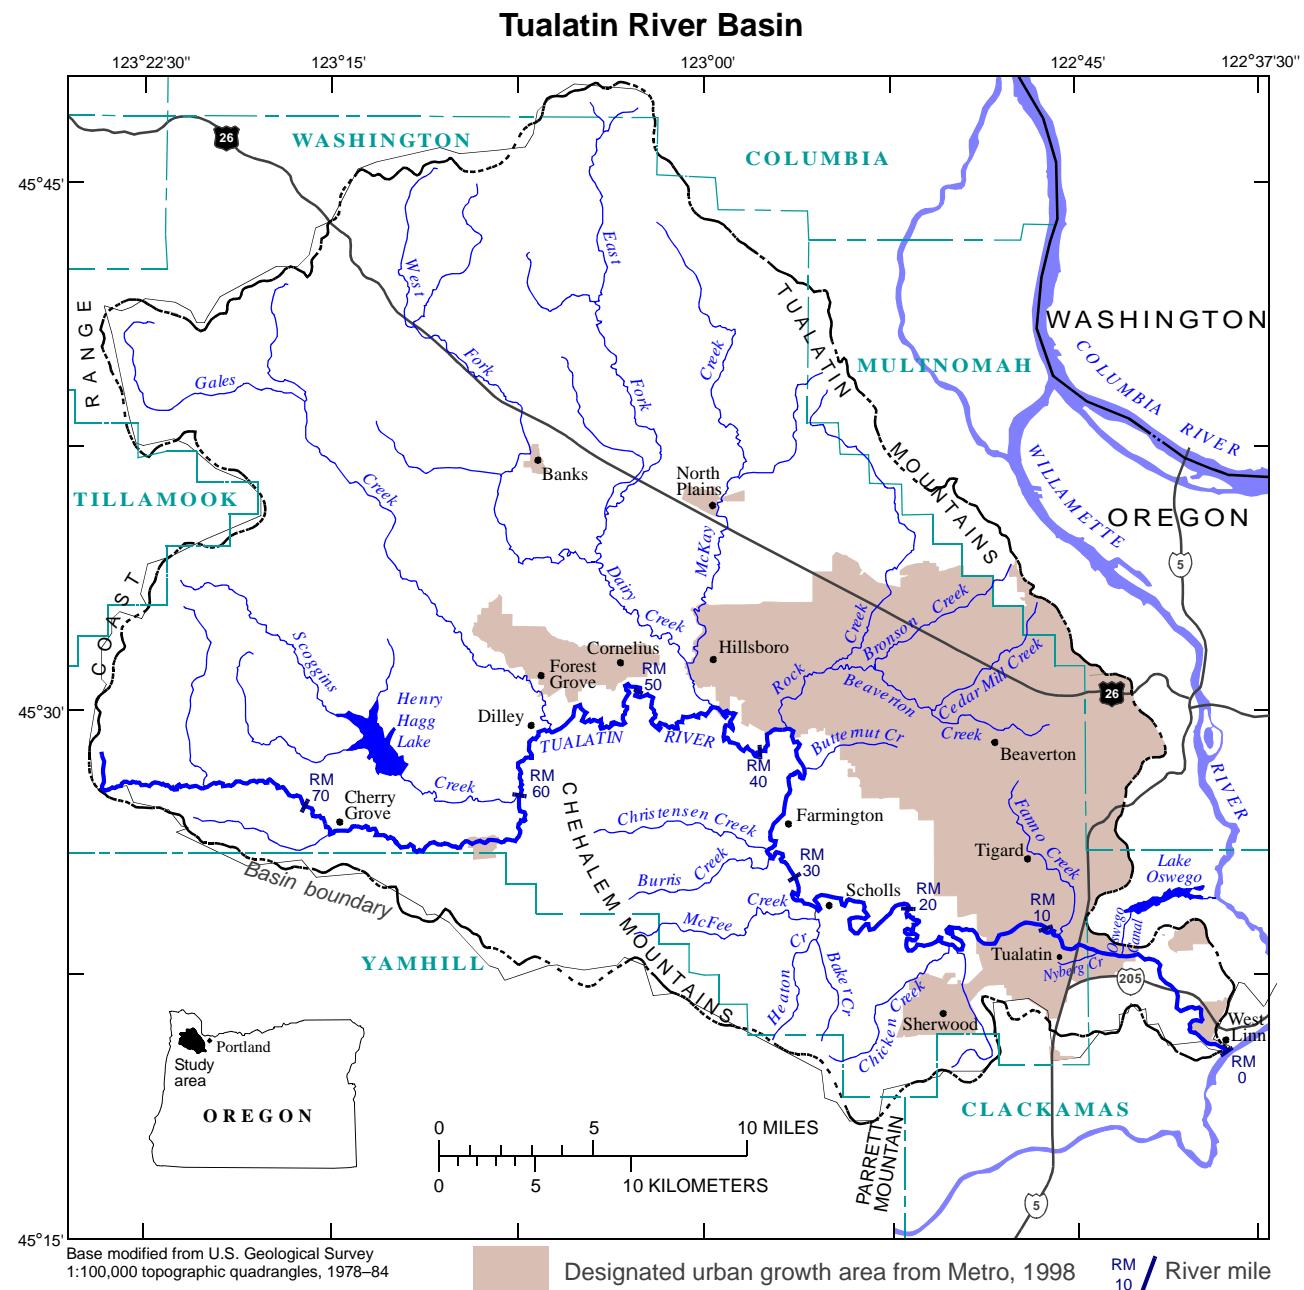

Clean Water Services: Clean Water Services (CWS) provides sanitary and stormwater services to the urban areas of Washington County. CWS has two major summer discharging wastewater treatment plants (WWTPs) that have permits to discharge water into the Tualatin River. The Rock Creek WWTP discharges an average of 50 cfs (33 MGD) at RM 38.1; the Durham WWTP discharges an average of 31 cfs (20 MGD) at RM 9.4. CWS also releases storage water from Scoggins and Barney Reservoirs for flow augmentation during the seasonal low flow periods. The goal is to maintain flow in the Tualatin River at Farmington Road Bridge gage (RM 33.3) at the following levels: 120 cfs (78 MGD) in early summer, 150 cfs (97) in mid-summer, and 180 cfs (120) in the fall before the rainy season begins.

Tualatin Valley Irrigation District: Tualatin Valley Irrigation District (TVID) is the agricultural water service agency for the area and serves approximately 20,000 acres of irrigated cropland. TVID operates the Patton Valley Pump Station at RM 1.71 on Scoggins Creek which can divert water via a low-pressure pipeline into the upper Tualatin River above the city of Gaston (outfalls at RM 63.2 and RM 64). This water is used to serve irrigators upstream of the Scoggins confluence (RM 60.0).

Water diversions from the Tualatin River

Cherry Grove Intake (RM 73.2): The City of Hillsboro diverts water for municipal and industrial uses at the Cherry Grove Intake. Hillsboro customers are served by this treatment facility and include the City of Gaston, the LA Water Cooperative, and rural residents of the Dilly and Cherry Grove areas.

Springhill Pumping Plant (RM 56.3): The Springhill Pumping Plant (SHPP) is the largest diversion facility on the river. It is operated jointly by the Tualatin Valley Irrigation District (TVID) and the Joint Water Commission (JWC). TVID delivers water from SHPP to about 12,000 acres of irrigated cropland via a pressure pipeline. TVID has a pumping capacity of approximately 90 MGD (140 cfs) at the SHPP. JWC delivers water from SHPP to the Cities of Beaverton, Hillsboro, Forest Grove and to the Tualatin Valley Water District (TVWD). JWC has a pumping capacity of approximately 60 MGD (90 cfs) at the SHPP. Both TVID and JWC have natural flow water rights that are used when flows are high; they release contracted stored water from Scoggins and Barney Reservoirs to augment declined natural flow in the summer.

Irrigation withdrawals: Water is obtained directly from the Tualatin River for irrigation purposes by members of the Wapato Improvement District (Wapato Lake), members of the TVID, and irrigators with natural flow water rights. About 5,000 acres of cropland served by TVID is irrigated with water obtained directly from the Tualatin River.

Lake Oswego Canal Diversion: The Lake Oswego Corporation (LOC) diverts a portion of the Tualatin flow into the Lake Oswego Canal at RM 6.7. A headwork structure regulates the flow into this mile long canal that feeds into Lake Oswego. The water is used to generate power below the dam at the east end of Lake Oswego. The Lake Oswego Corporation has a natural flow water right for 57.5 cfs (priority date: 1906) and has 500 acre-feet of contracted stored water for consumptive uses from Hagg Lake. At RM 3.4, a combination diversion dam/fish ladder structure is used during low flow periods to elevate the Tualatin River enough to divert the flow into the canal. During most of the year, river elevation is adequate to allow diversion of the LOC water right; in the summer, however, flash boards may be installed to increase the water level. This dam is 4 feet high and causes the water surface of the Tualatin River to be elevated for about 25 river miles upstream. LOC did not install flashboards in 2007. Since 2000, LOC has taken no more than 10 cfs from the Tualatin River.

Tualatin River Flow Management Technical Committee

The Tualatin River Flow Management Technical Committee provides a mechanism for the coordination and management of flow in the Tualatin River. The members of the committee are technical staff with detailed knowledge of the specific characteristics of flow in this river. The committee meets monthly from February through November. Meetings focus mainly on the review of the hydrographs and current status of the reservoirs. In addition, a variety of other water issues and any problems are discussed. Each member updates the committee on any changes that could impact the flow management of the Tualatin.

Data collection system

A coordinated information system was developed to provide flow information to all members of the committee. Because use or release of water by any one of the entities can impact the other users, coordination of flow information is an important aspect of the committee's work. The data are collected by field staff from the cooperating entities or from the Corps of Engineers via telemetry. A system of gaging stations, precipitation and other flow monitoring equipment has been developed during the past several years to monitor the flows on the Tualatin and the major tributaries. Significant releases and diversions are also monitored.

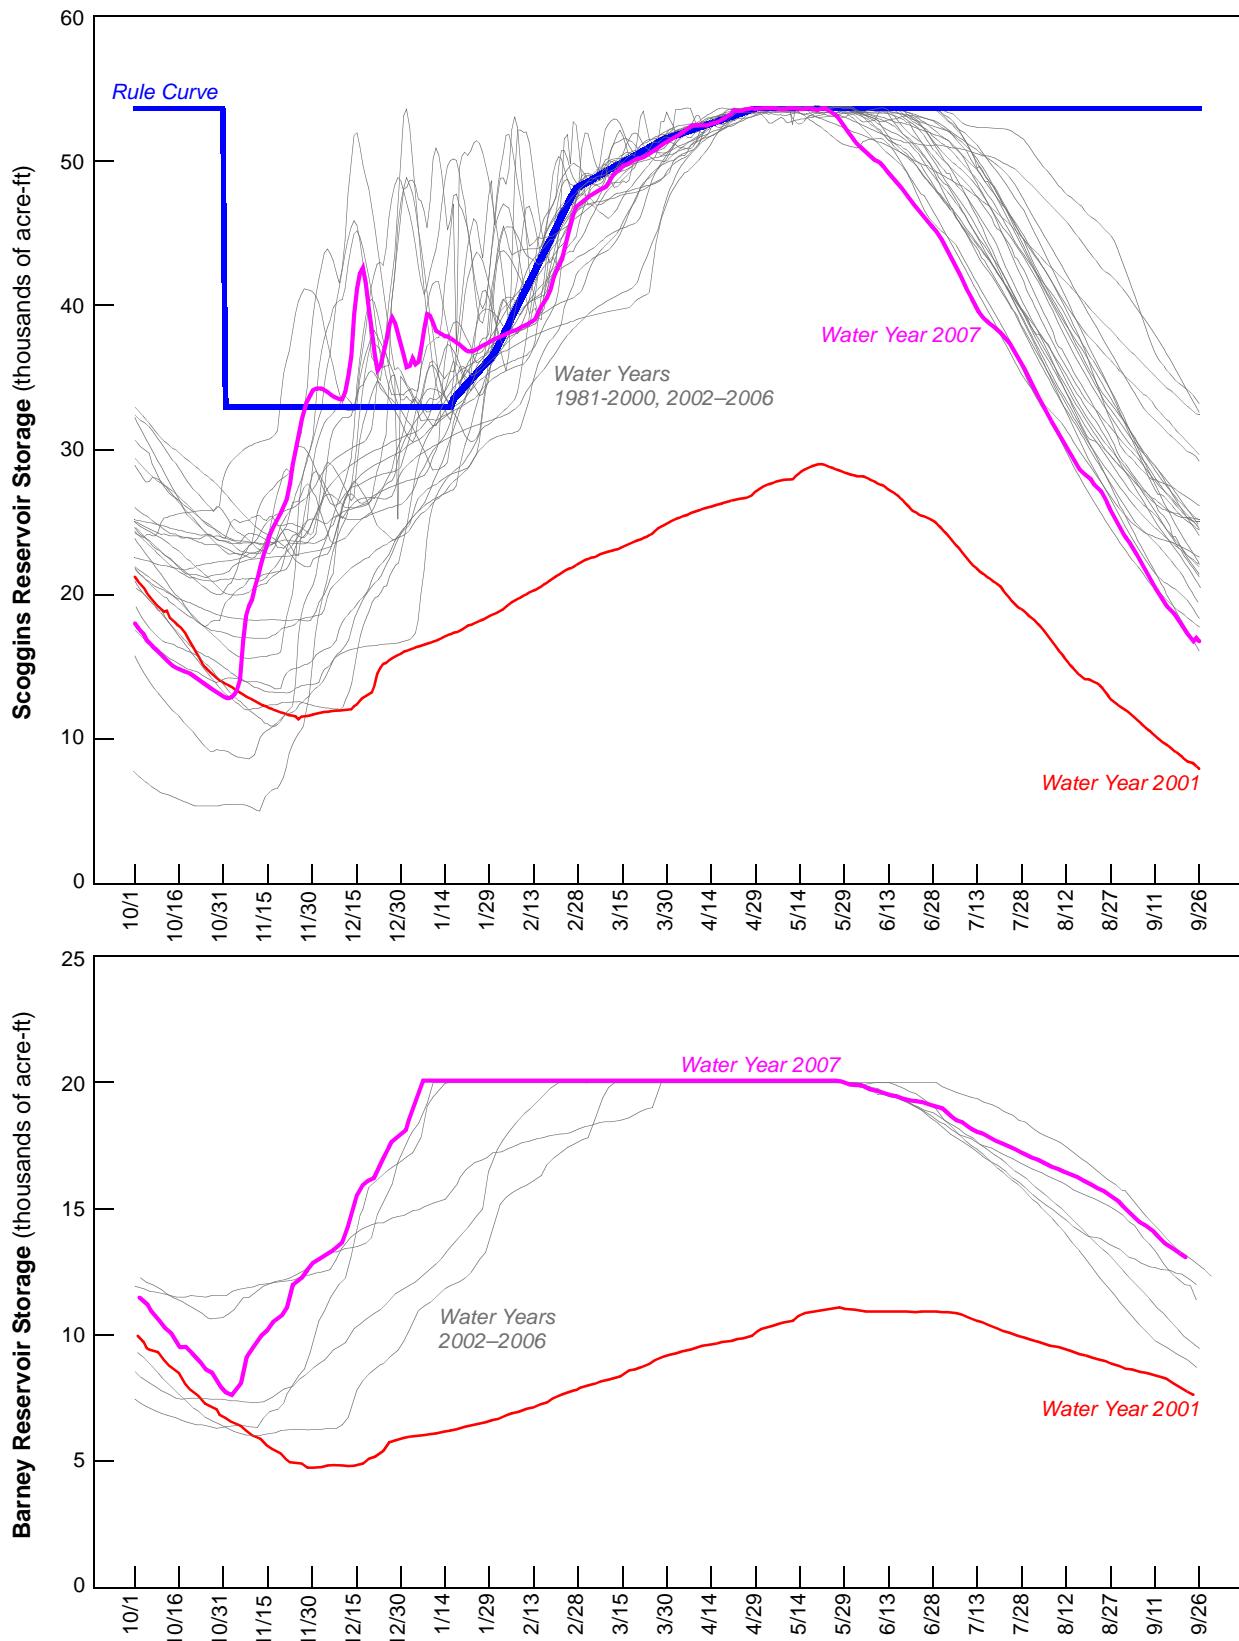

An expanding, on-going flow monitoring system continues to provide valuable information for the management of stored water and natural flow availability in the basin. It also makes the calculation of pollutant loads possible, when it is necessary for the Total Maximum Daily Load program (TMDL). Monitoring includes temperature as well as flow at some sites. As water quality issues have come to the forefront, the monitoring system has provided information vital to understanding the Tualatin basin, helped guide basin management, and been an excellent example of interagency cooperation.

Some of the monitoring data for the Tualatin Basin can be accessed at the following web sites:

- Bureau of Reclamation data: <http://www.usbr.gov/pn-bin/rtindex.pl?cfg=tual>
- Oregon Water Resources Division data: <http://www.goeslink.com/ordistrict18/>
- USGS data: http://or.water.usgs.gov/cgi-bin/grapher/graph_setup.pl?basin_id=tualatin

RESERVOIR STATUS

Both Scoggins and Barney Reservoirs filled in 2007. The fill curves for 2007 and the reservoir filling histories are shown below.

CLEAN WATER SERVICES

BY JAN MILLER, CLEAN WATER SERVICES

Water is released by Clean Water Services (CWS) from the Scoggins and Barney reservoirs to improve water quality in the Tualatin River. The Department of Environmental Quality issued an NPDES Water-shed-Based Waste Discharge Permit to Clean Water Services on February 26, 2004. After a legal challenge, changes were made to the stormwater section of the permit and the entire permit was reissued on July 27, 2005. It provides Clean Water Services with flexibility in meeting its wastewater treatment plant permit requirements by recognizing the benefit of the water that Clean Water Services releases from the two reservoirs.

The reservoir releases during July and August are traded to mitigate approximately 75% of the thermal impacts of the wastewater treatment plants. Clean Water Services offsets the remainder of its thermal impact by improving riparian habitat along the tributaries either directly within its service area or through a partnership with the Tualatin Soil and Water Conservation District on rural lands. During the rest of the summer, the water is released to offset the impact of sediment oxygen demand on the dissolved oxygen levels in the river. The dissolved oxygen levels in the river downstream of the wastewater treatment plants determine the ammonia limits for the wastewater treatment plants. The higher the dissolved oxygen levels are, the more operational flexibility the wastewater treatment plants have.

Low dissolved oxygen levels can be a water quality issue in the lower Tualatin River. During the early parts of the summer, photosynthetic production of oxygen by algae effectively offsets the oxygen consumed by the decaying substances in the sediment of the river (sediment oxygen demand). In the fall, however, oxygen production by algae is reduced as the days become shorter and it becomes too small to offset the oxygen consumption by sediment oxygen demand. This can lead to low dissolved oxygen levels. Increasing the flow of water minimizes oxygen consumption by sediment oxygen demand because it shortens the contact time between the river water and the river sediments.

2007 Water Releases

Clean Water Services initiated its release from Scoggins Reservoir on July 3, 2007. This was the fourth year with two primary goals. One goal was to release an average of 35 cfs for July and August for temperature trading. Clean Water Services released an average of 34.2 cfs during this period. The second goal was to have enough water left to mitigate the impact of sediment oxygen demand after the algal populations declined in mid-September. Storms at the end of September and in mid-October temporarily increased river flows negating the need for flow augmentation for much of October. Water releases resumed for the first half of November and ended on November 13, 2007 when Farmington flows reached 336 cfs and winter flow conditions started. Clean Water Services released a total 10,134 acre-feet from Scoggins Reservoir for the summer. This was 80% of its allocation.

Clean Water Services initiated a constant rate of release of 14 cfs from Barney Reservoir on September 1, 2007. It continued, unchanged, until October 30, 2007. Clean Water Services used a total of 1,667 acre-feet from Barney Reservoir.

Clean Water Services released flow augmentation water for a total of 133 days in 2007. The combined average daily release (for days with releases) was 33 cfs. Daily and monthly flow targets were met. The amount of water available to and released by Clean Water Services during 2007 and monthly details of the water releases are summarized in the tables on the following page. Clean Water Services flow augmentation and treatment plant flow accounts for a significant fraction of flow in the lower Tualatin River, especially during the late summer and early fall period (see graphs on page 12).

CLEAN WATER SERVICES WATER AVAILABILITY AND USE — 2007

Reservoir		Maximum Available (acre-ft)	Available (acre-ft)	Total CWS Release (acre-ft)
Scoggins Reservoir	Storage	12,618	12,618	10,134
	Natural flow credit	4,282	0	—
Barney Reservoir	Storage	2,000	1,667	1,667
	Summer storage	—	—	—
Total		18,900	14,285	11,801
Percent of available				
82.6%				

CLEAN WATER SERVICES WATER RELEASE SUMMARY 2007

	Units	May	June	July	Aug	Sept	Oct	Nov 1-3	Total
Scoggins Release	acre-ft	0	0	1,244	2,966	3,422	895	1,607	10,134
	days	0	0	29	31	30	16	13	119
Barney Release	acre-ft	0	0	0	0	833	833	0	1,667
	days	0	0	0	0	30	30	0	60
Total Release	acre-ft	0	0	1,244	2,966	4,256	1,728	1,607	11,801
Daily Average Release (for days with releases)	cfs	0	0	22	48	72	28	62	44

Measured Flows and Flow Goals for Tualatin River at Farmington (RM 33.3)

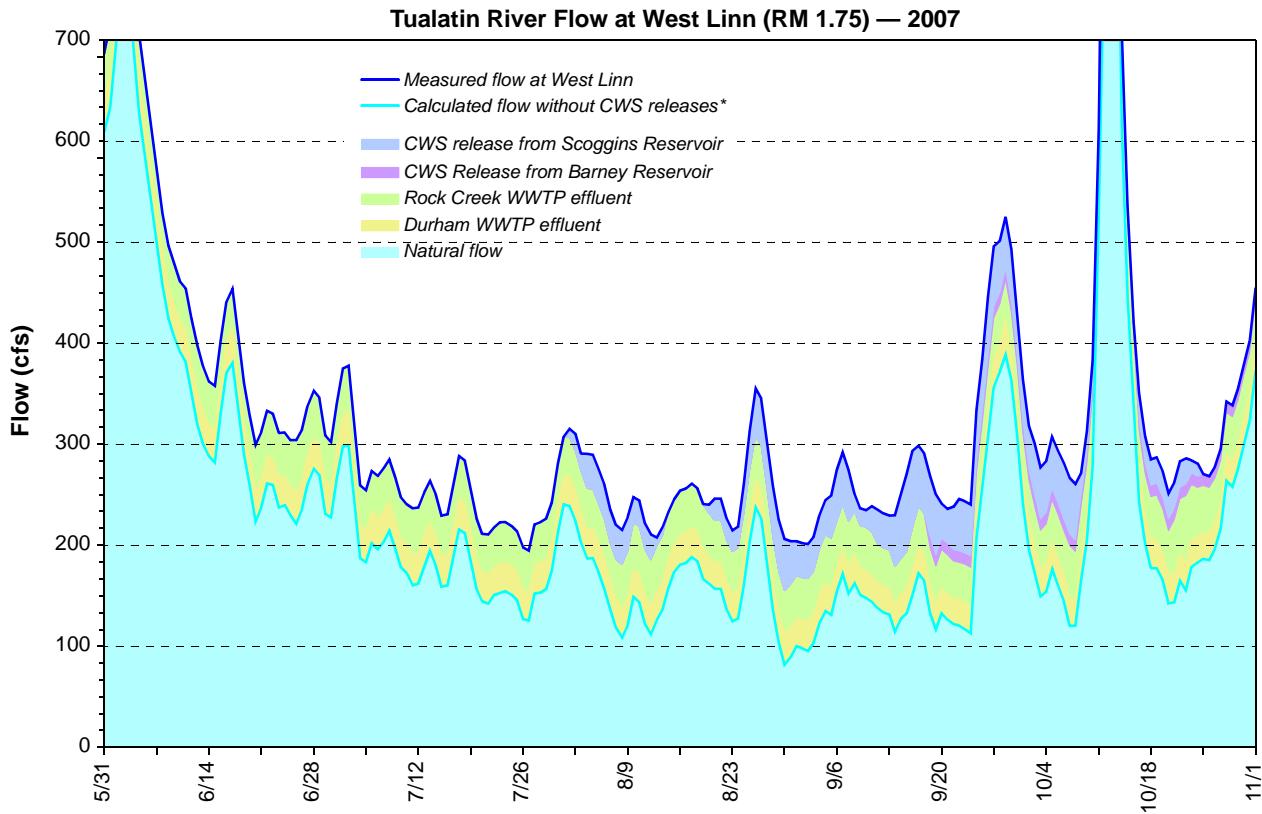

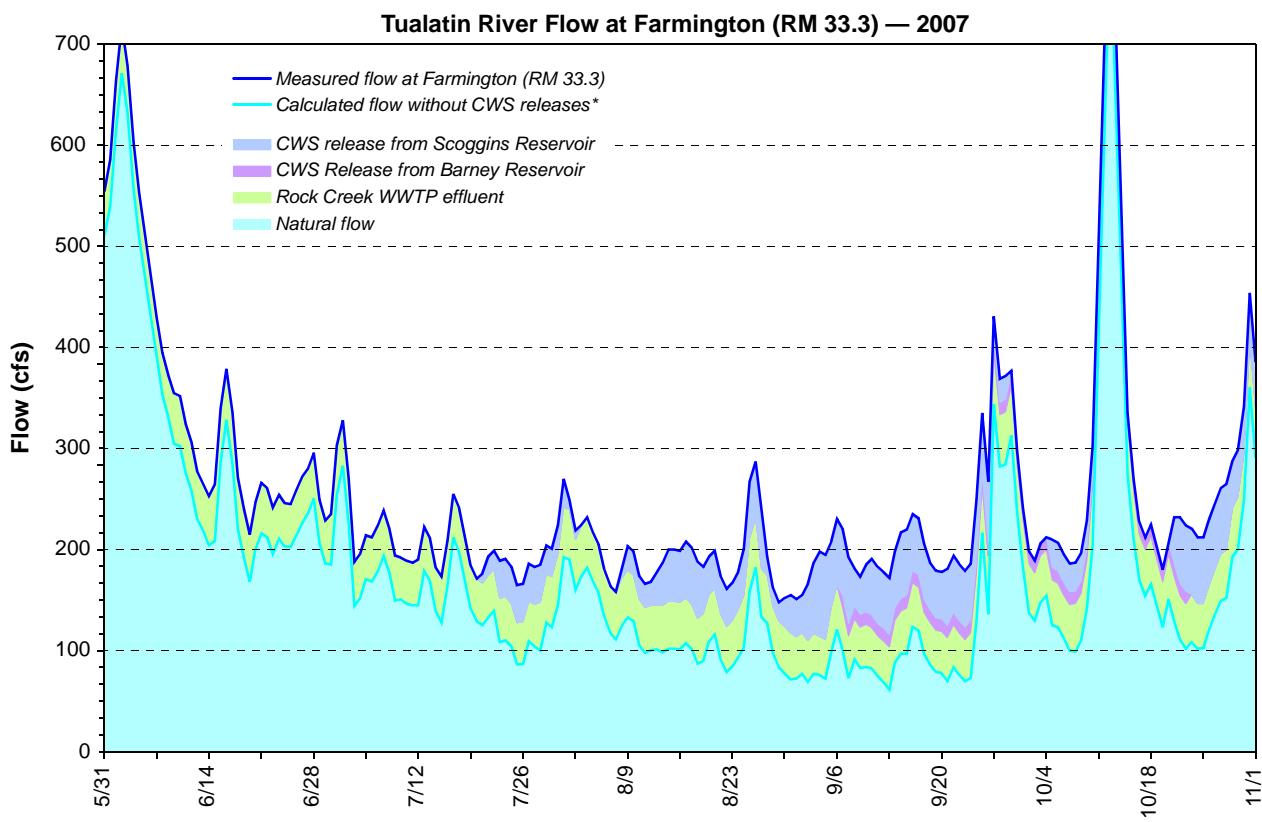

Measured minimum	cfs	214	170	155	145	170	176	209	—
Measured mean	cfs	384	227	195	183	201	310	247	—
Measured maximum	cfs	717	323	266	281	328	892	336	—
Daily minimum flow goal	cfs	120	120	120	120	120	120	120	—
Monthly mean flow goal	cfs	120	120	120	150	180	180	180	—

Natural flow credit

If the natural flow in the Tualatin River measured at West Linn is less than the flow target for the months of May, June, October and November, then CWS receives a natural flow credit of up to 4,282 acre-ft. Natural flow is calculated as the actual measured flow minus the CWS released flow. The table below shows that the natural flow at West Linn exceeded the flow targets for these four months, and therefore, CWS was not entitled to a natural flow credit in 2007.

BUREAU OF RECLAMATION NATURAL FLOW CREDIT 2007

Month	Mean Daily Measured Flow at West Linn (cfs)	Mean Daily CWS Release (cfs)	Calculated Natural Flow at West Linn (cfs)	Target Natural Flow at West Linn (cfs)	Maximum Possible CWS Natural Flow Credit (cfs) [acre-ft]	CWS Natural Flow Credit (cfs)
May	504	0	504	85	13 [798]	0
June	295	0	295	140	21 [1250]	0
October	430	28	402	95	16 [984]	0
November	616	27	589	110	21 [1250]	0

*Flows without CWS releases were calculated as follows. (Constant travel times and a uniform evaporative loss of 0.25% per mile were assumed.)

Flow at Farmington without CWS releases =

$$\begin{aligned}
 &+ \text{Measured flow at Farmington} \\
 &- 0.988 \times \text{Rock Ck WWTP flow from the same day} \\
 &- 0.933 \times \text{CWS Scoggins Release from 2 days before} \\
 &- 0.888 \times \text{CWS Barney Release from 4 days before}
 \end{aligned}$$

Flow at West Linn without CWS releases =

$$\begin{aligned}
 &+ \text{Measured flow at West Linn} \\
 &- 0.981 \times \text{Durham WWTP flow from 3 days before} \\
 &- 0.909 \times \text{Rock Ck WWTP flow from 14 days before} \\
 &- 0.854 \times \text{CWS Scoggins Release from 17 days before} \\
 &- 0.809 \times \text{CWS Barney Release from 19 days before}
 \end{aligned}$$

Historical perspective

In 1987, Clean Water Services begin managing the release of its water with the goal of maintaining a monthly average of 150 cfs at the Tualatin River at Farmington. Work by the United States Geological Survey in the early 1990's indicated that it was more important to have higher flows in the fall to maintain dissolved oxygen levels than in the early summer to prevent algal blooms. The flow goals were changed to maintaining 120 cfs in the early summer, 150 cfs in August and then 180–200 cfs from September until the winter flows start. Winter flows are defined as flows that exceed a 7-day median of at least 350 cfs. In 2004, an additional goal of releasing water in July and August for temperature trading was added. The following table shows the history of Clean Water Services releases from Scoggins Reservoir

CLEAN WATER SERVICES — SCOGGINS RESERVOIR RELEASES

Year	Start Date	End Date	Total Release Days	Total Release (acre-ft)	Average per Release Day (cfs)	Minimum Monthly Flow at Farmington (RM 33.3) (cfs)
1987	6/9	11/30	175	16,722	48.2	138
1988	7/2	11/4	126	15,071	60.3	149
1989	6/27	11/15	141	16,586	59.3	158
1990	7/12	11/1	113	11,889	53.0	172
1991	7/12	11/4	116	13,024	56.6	181
1992	6/5	11/19	168	12,730	38.2	138
1993	7/3	12/1	150	11,486	38.6	154
1994	6/21	10/27	129	10,917	42.7	137
1995	6/24	11/8	138	9,824	35.9	174
1996	7/27	11/10	114	10,952	48.4	205
1997	7/4	10/2	91	6,716	37.2	202
1998	8/12	11/7	87	9,407	54.5	175
1999	7/27	11/12	109	12,001	55.5	188
2000	7/21	11/27	130	15,275	59.2	174
2001	9/25	11/14	50	2,403	24.0	114
2002	6/12	11/9	151	12,618	42.0	103
2003	7/11	11/17	130	11,765	52.4	107
2004	7/1	11/2	125	8,650	34.9	130
2005	7/8	10/31	116	9,918	43.1	153
2006	7/1	11/3	126	9,634	38.5	148
2007	7/3	11/13	119	10,134	42.9	145

Water is released from Barney Reservoir at a constant rate during the late summer to supplement the water released from Scoggins Reservoir. The following table shows the historic use of Barney Reservoir releases. Clean Water Services owns 10% of the 20,000 acre-foot reservoir. Each year the Joint Water Commission decides how much water is to be released for the Department of Fish and Wildlife. This, plus the dead pool, is subtracted from the available water. The remainder is allocated to the owners.

CLEAN WATER SERVICES — BARNEY RESERVOIR RELEASES

Year	Start Date	End Date	Total Release (acre-ft)	Daily Release Rate (cfs)	Comment
1998	7/12	8/27	2,779	24.6	extra water released to draw down reservoir
1999	9/1	10/19	1,025	10	10 cfs also released 6/4–6/10
2000	9/8	10/23	1,461	18	—
2001	9/18	10/29	1,416	17	1000 acre-ft purchased in addition to allocation; reservoir did not fill; 4,000 acre-ft held in reserve
2002	8/26	10/24	1,667	14	—
2003	8/15	10/14	1,742	14	—
2004	9/1	11/2	1,777	14	—
2005	9/1	11/8	1,874	14	miscommunication about end date; extra water released
2006	9/1	11/3	1,638	14	—
2007	9/1	10/30	1,667	14	—

JOINT WATER COMMISSION & JOINT BARNEY COMMISSION

BY NIKI IVERSON, WATER RESOURCES MANAGER, JOINT WATER COMMISSION/CITY OF HILLSBORO

Over 300,000 people in Washington County receive at least a portion of their water from JWC. The Joint Water Commission (JWC) provides water to its member agencies: the cities of Hillsboro, Forest Grove, Beaverton and Tigard, and the Tualatin Valley Water District. JWC also provides wholesale service directly to the city of North Plains, and to Cornelius, Gaston, and LA Water Cooperative as wholesale customers of Hillsboro. JWC's water production averages approximately 33.1 million gallons per day. During the peak periods of the summer, production increases substantially; in 2007 production peaked at 58.4 million gallons per day. JWC's highest peak production was 60 million gallons per day in 2006.

JWC's water treatment plant is supplied with water from the nearby Tualatin River. Water is pumped from an intake facility at Spring Hill that was constructed by the Bureau of Reclamation and is shared with the Tualatin Valley Irrigation District (TVID). Flows in the Tualatin River are supplemented during the summer with water from impounds at Scoggins Dam (Hagg Lake) and Barney Reservoir. Scoggins Dam is owned by the Bureau of Reclamation and is operated by contract with TVID. The Barney Reservoir Joint Ownership Commission (BRJOC) is the owner of Barney Reservoir, which is formed behind the Eldon Mills Dam on the Trask River. BRJOC includes Hillsboro, Forest Grove, Beaverton, and Tualatin Valley Water District as well as Clean Water Services.

The JWC water treatment plant uses conventional, dual media filtration, along with disinfection, to produce high quality potable water. Treated water is pumped from the plant to the member agencies either directly through finished water pipelines leaving the plant or via the Fern Hill Reservoirs. Fern Hill Reservoirs include two 20 million gallon covered concrete tanks, for a total of 40 million gallons of storage, located about one-third mile to the east of the treatment plant. The second 20 million gallon reservoir was recently constructed at the Fern Hill Site and began operation in October 2006. The JWC finished water pipelines include master meter and pressure reducing stations at the connection points to the member agencies.

JWC continued its emphasis on maximizing the capture of our source waters through improved coordination of the operation of Fern Hill Reservoirs with JWC member system demands, and through careful tracking of individual member use of their stored water. The 2007 stored water release program had continued success during our peak season, as the JWC pump station recovered 96.4% of the water available to us at our intake from our natural flow rights and releases from our impounded supplies.

JWC appreciates the efforts of the watermaster and our partners on the Flow Management Committee, and we extend our thanks for all of their involvement and cooperation. The communication and coordination that comes from this committee among the various Tualatin River users is invaluable to us.

SUMMARY OF 2007 RELEASE SEASON

Description	Beginning Balance (acre-ft)	Amount Released (acre-ft)	Calculated Inflow (acre-ft)	Ending Balance (acre-ft)	Average Release (acre-ft/day)
Breakdown by Reservoir					
Scoggins	13,500.00	10,371.72		3,128.28	66.91
Barney (M&I)	14,886.00	5,543.88	906.20	9,342.12	35.77
Total	28,386.00	15,915.60	906.20	12,470.40	102.68
Breakdown by Agency – Including Leased Allocations					
Hillsboro	9,327.40	4,602.24		4,725.16	29.69
Forest Grove	2,413.50	1,245.43		1,168.07	8.04
Beaverton	6,556.10	3,852.43		2,703.67	24.85
TVWD	9,589.00	5,735.32		3,853.68	37.00
Tigard	500.00	480.18		19.92	3.10
Total	28,386.00	15,915.60		12,470.40	102.68

Reservoir release detail after reallocation for leases (total released by storage ownership):

	Reservoir Release (acre-ft)			Average Release (acre-ft/day)
	Barney	Scoggins	Total Release	
Hillsboro	978.33	4,200.21	5,178.54	31.06
Forest Grove	485.64	2,519.01	3,004.64	24.70
Beaverton	897.54	3,652.51	4,550.05	39.20
TVWD	3,182.37	—	3,182.37	26.49
Total	5,543.88	10,371.72	15,915.60	121.45
North Plains usage is reflected in the figures for JWC partners:		49.09	0.32	

COMPARISON OF STORED WATER RELEASES— 2006–2007

Year	Begin Date	End Date	Days Regulated Use	Stored Water Release (acre-ft)			Average Release (acre-ft/day)
				Barney	Scoggins	Total	
2007	5/25/2007	11/13/2007	155	5,543.88	10,371.72	15,915.60	102.68
2006	5/18/2006	11/3/2006	160	8,100.61	11,331.74	19,432.35	121.45

ESTIMATED WATER CAPTURE RATES (THROUGH 11/14/2007)

Peak production for season:	179.20 acre-ft/day
Average production for season:	116.91 acre-ft/day
Stored water released:	15,915.60 acre-ft
WRD loss factor:	-533.09 acre-ft
Natural flow:	+3,988.82 acre-ft
Total water available to be pumped:	19,371.33 acre-ft
Raw water pumped at Springhill Pump Station:	17,913.75 acre-ft = 92.48% of available
Water produced through Slow Sand Filter Plant:	509.37 acre-ft
Total water pumped for regulated season:	18,423.12 acre-ft = 95.11% of available
Finished water produced:	18,156.16 acre-ft = 93.73% of available
Total production:	18,665.53 acre-ft = 96.36% of available

LAKE OSWEGO CORPORATION

BY MARK ROSENKRANZ, WATER RESOURCE SPECIALIST

Introduction

The Lake Oswego Corporation (LOC), a non-profit organization, owns and manages Oswego Lake, a 168-hectare (403 acre) reservoir located 10 miles south of Portland, Oregon. LOC was formed in 1942 when the Oregon Iron and Steel Company, then owner of the land around the Lake, deeded to LOC the land, three dam structures, and all water rights. The original dam was constructed in 1871 and later upgraded in 1921. Oswego Lake is a private water body whose primary water right is hydropower generation. Secondary uses include irrigation, aesthetic viewing, contact recreation, fishing, and boating.

Oswego Lake and Watershed Morphology

The original natural lake, called Waluga, was formed 10,000 years ago by the Missoula glacial floods, altering the old Tualatin River channel. Today, the Lake has three basins: West Bay, the Main Lake, and Lakewood Bay. There are also two shallow, man-made canals, Blue Heron Canal and Oswego Canal. Oswego Canal is the 2.4-km conduit from the Tualatin River (RM 6.7). Total lake surface area and volume is 1.63 km^2 (403 acres) and $12.7 \times 10^6 \text{ m}^3$ (10,300 acre-feet). Shoreline length, including bays and canals, is 18.62 km (11.56 mi.). Oswego Lake has a 5.08-km (3.15-mi) fetch and a narrow 0.56-km width (0.34-mi). The hydraulic residence time is 390 days.

Oswego Lake's two watersheds include the natural, 7.5 mi^2 urban basin around the Lake (10:1 watershed to lake-area ratio) and the larger 700 mi^2 Tualatin River basin (1,000:1 ratio) when the LOC Headgate is opened. Major inflows from the watershed include Springbrook Creek, Lostdog Creek, Blue Heron Creek, and 70-plus storm drains from the City of Lake Oswego.

LOC Water Rights

Hydro Power

The primary hydro power water right is 57.5 cubic feet per second (cfs) obtained in 1906 that allows year around diversion. To guarantee this flow during the dry season, LOC owns and operates a diversion dam located downstream of the Oswego Canal (RM 3.4). Flaps are erected on an "as needed" basis. In 2007, no flaps were used.

Irrigation

There is also a 1974 irrigation water right of 500 acre-feet for the irrigation season, March - October. LOC proved up their irrigation water right in 2000 with the Bureau of Reclamation and the Oregon Water Resources Department. The largest irrigator on the Lake is the Lake Oswego Country Club (approximately 175 acre-feet).

Maintenance/Evaporation

The third water right is the 1985 maintenance/evaporation water right of 3.36 cfs. This water can be diverted between September 16th and July 30th.

2007 Oswego Lake Management Summary

Water quality improvements and safety are the top priorities for LOC. The goal for the annual LOC Water Quality Management Plan is to reduce Cyanobacteria productivity and maximize the aesthetic value of the Lake by focusing on flow management, water quality treatment, and macrophyte issues.

Lake Water Quality

In 2007 the Oswego Lake water quality-monitoring program included six sites where water clarity, nutrient content, biological productivity, and chemical profiles were recorded. The year-round monitoring was conducted weekly during June through September and bi-weekly from October through May.

2007 OSWEGO LAKE WATER QUALITY SUMMARY AVERAGES

Location	Season	Chlorophyll-a ($\mu\text{g/L}$)	Total P ($\mu\text{g/L}$)	SRP ($\mu\text{g/L}$)	Total N ($\mu\text{g/L}$)	Secchi (m)	Turbidity (NTU)
Lakewood Bay	Annual	9	26	2	4.3	2.3	1.9
	Summer	12	33	2	397	1.6	2.8
Main Lake	Annual	12	28	4	543	3.1	2.4
	Summer	9	26	5	382	3.0	2.7
West Bay	Annual	10	54	15	1261	1.2	3.0
	Summer	9	42	3	523	1.2	2.7
Oswego Canal	Annual	5	165	63	3736	0.8	4.8
	Summer	7	175	65	3975	<u>0.8</u>	4.8
Blue Heron Canal	Annual	13	53	6	1026	1.0	4.7
	Summer	<u>6</u>	41	3	950	1.1	3.3
Outlet	Annual	11	24	2	505	3.1	2.2
	Summer	8	<u>22</u>	<u>2</u>	<u>324</u>	3.2	<u>2.2</u>

Bold = highest average during the summer; Underline = lowest average during the summer

Summer=June–September

Abbreviations: Total P = Total Phosphorus, SRP = Soluble Reactive Phosphorus, Total N = Total Nitrogen, Secchi = Secchi depth, Turb = Turbidity; ug/L = micrograms per liter, m = meters, NTU = nephelometric turbidity units, C = Celsius

Algae: Although the summer was dominated by cyanobacteria this year, West Bay and Main Lake concentrations were reduced from previous years because of periodic surface alum applications and ongoing alum injection. Lakewood Bay will need increased attention in the future as cyanobacteria is becoming problematic in this section of the lake. Our alum program has been effective in reducing phosphorus and the resultant cyanobacteria growth. Alum will continue to be used as necessary to reduce phosphorus that promotes algae and cyanobacteria. Nutrient input from the watershed and Tualatin River will have to be dramatically reduced in order to greatly reduce the amount of active management required to control phosphorus.

Macrophytes: Spring herbicide applications in Lakewood Bay and Half Moon bay were successful in controlling invasive *Potamogeton crispus* (curlyleaf pondweed). Later applications to Blue Heron Canal, Oswego Canal, and West Bay were used to control curlyleaf and invasive *Egeria densa* (Brazilian elodea).

In addition to herbicides, macrophytes are controlled by an aquatic weed harvester and diver hand-pulling. Harvesting is most effective when large areas of vegetation have reached the surface. Harvesting will clip vegetation about five feet below the surface. Hand-pulling is an effective long-term control solution used for removing complete plants from root to stem. A barge is equipped with a four inch suction hose that draws in plants where they are macerated and emptied into a tote for removal.

Chemical Treatments: Chemical treatments were limited to herbicide applications to control non-native aquatic weeds. In 2007 Lakewood Bay, Half Moon Bay, Kelok Bay, Oswego Canal, Blue Heron Canal, and West Bay were treated with herbicide.

Alum Treatments: This year LOC surface applied 45,000 gallons liquid alum and injected 8,800 gallons. Our surface applications occurred in Lakewood Bay, West Bay, Oswego Canal, Blue Heron Canal, and the West End. Alum injectors are installed in the same locations as mentioned above except for the West End.

Oswego Lake Watershed Management

To provide long-term water quality solutions and to be proactive in preserving the quality of the Lake, watershed activities are a major part of the LOC management plan.

Tualatin River Flows

Minimal Tualatin river flows were used for keeping the lake full. It is desirable to reduce river flow into Oswego Lake due to high phosphorus and sediment concentrations in the river water.

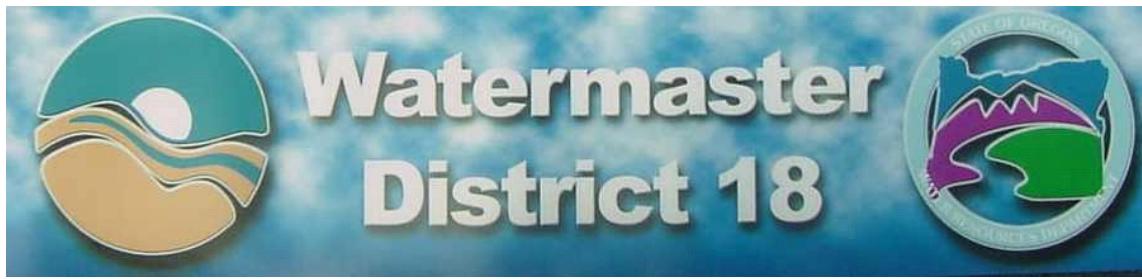

Oswego Lake Basin

A comprehensive storm sampling program in collaboration with the City of Lake Oswego continues. Sampling targets six stations on Lost Dog Creek on the south shoreline and nine outfalls on the lake perimeter. Data collected were phosphorus, nitrogen, total suspended solids, turbidity, and flow.

Management in the Future

LOC continues to monitor the Lake and watershed to better understand the ecosystem. Future plans are:

- Continue to implement the integrated aquatic plant management plan involving hand pulling, harvesting, and herbicides
- Continue educating watershed residents about water quality impacts
- Assess conditions in bays and canals and propose localized solutions
- Work with City to improve surface water runoff to the Lake
- Maximize the water quality improvements with the 2-layer lake aeration system
- Continue to use aluminum sulfate as a phosphorus reduction tool.

OREGON WATER RESOURCES DEPARTMENT BY DARRELL C. HEDIN, WATERMASTER, DISTRICT 18

Introduction

The District 18 Watermaster's Office is a field office of the Oregon Water Resources Department (OWRD) in cooperation with Washington County, and is responsible for water supply management within the Tualatin, Lake Oswego, and Lower Willamette Drainage Basins.

The Watermaster's Office is part of the Field Services Division of OWRD. There are twenty Watermaster Districts statewide, organized into five regions. The Watermaster functions as a local contact for landowners, elected officials, and watershed councils, as well as other governmental agencies at the local, state and federal level. Duties include conducting streamflow measurements and maintaining gaging stations, in addition to performing well inspections and collecting groundwater level data. Information is also provided to landowners and others on water rights and Oregon Water Law. The Watermaster is also responsible for regulating water use during times of shortage.

Oregon Water Laws

Under Oregon law, all water is publicly owned. With some exceptions, cities, farmers, factory owners, and other water users must obtain a permit or water right from the Water Resources Department to use water from any source, whether it is underground, or from lakes or streams. Generally speaking, landowners with water flowing past, through, or under their property do not automatically have the right to use that water without a permit from the Department.

Oregon's water laws are based on the principle of prior appropriation. This means the first person to obtain a water right on a stream is the last to be shut off in times of low streamflows. In water-short times, the water right holder with the oldest date of priority can demand the water specified in their water right regardless of the needs of junior users.

There are four fundamental provisions under Oregon's Water Code:

Beneficial purpose without waste: Surface or groundwater may be legally diverted for use only if it is used for a beneficial purpose without waste.

Priority: The water right priority date determines who gets water in a time of shortage. The more senior the water right, the longer water is typically available for use.

Appurtenancy: Generally, a water right is attached to the land described in the right, as long as the water is used. If the land is sold, the water goes with the land to the new owner.

Use: Once established, a water right must be used as provided in the right at least once in every five year consecutive period. With some exceptions if nonuse occurs over a consecutive five year period the right is considered forfeited and is subject to cancellation.

Watermaster Department for 2007

Overall the year turned out to be fairly normal for streamflows in the Tualatin Basin. Regulation began on May 29 due to early dry conditions that dropped streamflows. As has happened many times before, rain events came again shortly after regulation and restored flows long enough to lift regulation for some until the middle of June. The regulation summary for the 2007 irrigation season is below. The Watermaster continues to work on the Significant Diversion Inventory whose goal is to achieve compliance with permit conditions for surface water diversions. Typically the conditions are that users install metering on their pumps and keep track of water usage.

2007 WATER RIGHTS REGULATION SUMMARY

Date	On/Off	Regulatory Activity	Mile	Back To
5/29/2007	Off	City of Beaverton (P-45455, 7/15/1980) – Tualatin River City of Forest Grove (P-40615, 4/28/1976) – Tualatin River City of Hillsboro (P-46423,2/6/1974) – Tualatin River City of Hillsboro (P-50879, 6/9/1988) – Scoggins Creek TVID (P-35792) – Scoggins Cr	>56.09	2/5/1974

Tualatin River Flow Management Technical Committee

The Watermaster and staff would like to thank all the committee members for your continued financial support of the Tualatin and Lake Oswego Basins gaging station network and also your weekly reporting of information to this office. The monthly graphs and technical reports compiled by this office and distributed during the Flow Management meetings are an important part of assessing the current conditions of the basin and are only possible with your support. It is through this collaboration and support that the Flow Management Committee has attained the highest levels of success within the basin.

TUALATIN VALLEY IRRIGATION DISTRICT

BY WALLY OTTO, RESERVOIR SUPERINTENDENT

Introduction

The Tualatin Valley Irrigation District (TVID) was formed in 1962 and is located in Forest Grove Oregon. According to records, in 1915 about 15 acres were irrigated in Washington County. By 1933, that total had grown to 130 acres. In 1951, there were a total of 18,455 acres with water rights in Washington County registered with the Office of Oregon State Engineer. This office is currently known as the Oregon Water Resources Department (OWRD) and located in Salem. The Tualatin Basin is included in OWRD District 18 headquartered in Hillsboro. When the Irrigation District was formed in 1962, the total acreage with water rights had increased to 33,885 acres. TVID was formed to assist in the delivery of irrigation water to about half of those acres (17,000) in the Tualatin Basin. The water was supplied from natural flow and return flows. This remained difficult since the two water supplies were extremely limited due to the early summer withdrawals from the River and the increasing need for irrigation. Beginning in 1975, additional water became available that was stored in the winter behind the newly completed Bureau of Reclamation Project, Scoggins Dam. Most of the water from these three sources is now pumped from the Tualatin River at the Spring Hill Pump Plant. Today, the majority of water is delivered to patrons through approximately 120 miles of pressurized pipeline. Additional water flows down both Scoggins Creek and the Tualatin River is withdrawn by irrigators with land abutting the River. They are known as "River Users" and pay for their own pumping costs since they are not associated with the pressure pipeline system. When natural flow no longer meets demand, the District 18 Watermaster begins regulating "junior" water users off. The TVID storage right is dated 1963 so anyone with water rights after that date must stop withdrawing water from the River before TVID. Storage water is discharged from Scoggins Reservoir (Henry Hagg Lake) to either augment the river flow or supply the entire need for the Irrigation District patrons (both the pump plant/pressure pipeline users and the river users). Water for some of the District members on the lower Tualatin River is supplied by reuse water discharged from the two Clean Water Services treatment plants. Crops irrigated with District water range from row crops including blueberries, blackcaps, corn, pumpkins and other vegetables to nursery stock.

2007 TVID Overview

During 2007, TVID used 22,114 acre feet of water from storage. This was a record amount for the District. For a 20 year average, it came in at 136%. For the 10 year average, it was 132%. It bypassed the previous high set in 2006 by 990 acre feet. Once again, the high use of storage water was in part caused by the extended season for irrigation allowed to TVID beginning in March and ending in November by the extended water season in agreement with the OWRD. All water used outside the normal irrigation season of April through October must come from TVID's annual contracted storage allotment of 27,022 acre feet.

Peak use (135 cfs) for the District came on July 12th. The high temperature had been 98 °F on the 11th and 94 °F on the 12th. Even though the temperatures later dropped into the 80's, demand remained high for a week. Then again in late July until August 17th, demand increased and remained between 98 and 129 cfs. This once again was related to the temperatures rising to the 80's and 90's. The month of November continued to require water from storage with an average of 3 cfs. During November, only 4.68" of precipitation was received at the dam. This was 59% of average for the month and container nurseries required water.

The extension of the irrigation season for the Tualatin Valley Irrigation District has made growing specialty crops in the District much more appealing. Primarily used for berries and later for the nurseries, a much more diverse list of crops can be served water. Nursery stock including flowers can now be raised well into November when protected by greenhouses. The District is now home to many small specialty nurseries along with several large operations. Water along with our moderate climate is critical for their success.

TVID Water Use

TVID is allowed to provide water to 17,000 acres. In 2007, a total of 16,466.9 acres were mapped and received water from the District. The following table breaks down how the District water was distributed within the three usage categories.

WATER YEAR 2007 CROP SUMMARY

Water Use	Irrigated Acres	Breakdown by Crop	
		Crop	Irrigated Acres
High	6567.5	Berries	2365.6
		Nursery, Flowers	4201.9
Medium	3732.7	Corn	1245.5
		Turf, Yard, Garden	1793.8
		Vegetables – non-corn	693.4
Low	6166.7	Grain	1412.3
		Grass	2613.8
		Pasture, Trees, Nuts, Willow, Grapes	2140.6
Total (permits 35792 and 49958)		16466.9	

2007 TVID Operation and Maintenance

TVID delivers irrigation water by high pressure pipeline to customers from Gaston to North Plains and from West of Forest Grove to Highway 219 South of Hillsboro. The water is withdrawn from the Tualatin River near Fern Hill, south of Forest Grove. It is lifted by pumps to a water regulating tank on Blooming-Fern Hill and is then under gravity pressure from the tank to all points of delivery. Preventative maintenance continues to keep service delivery as dependable as possible. Several minor disruptions of service did occur during the year but were quickly isolated and repaired. Service was restored within minutes in some cases to a day if conditions did not allow quick access. One disruption came when a world wide equipment manufacturer staged a field demonstration of their trackhoe line. It was staged on property with a 27" TVID pipeline crossing the field in a dedicated easement! There were eight large machines digging "potholes" for demonstration purposes. The Oregon Utility Notification Center (Call before you Dig) had not been notified of the planned activity as required by Oregon law. The property owner had not notified TVID. The manufacturer was just told by the property owner that they could "dig up the field." This repair took more time than usual. A one inch hole was put into the steel pipe but because the accident occurred at the base of a hill, it took two days to drain the water out before repair could begin. A large steel plate was welded in place when access became available. Fortunately, this incident occurred in May before the water demand was critical. Most nurseries had alternate sources-ponds or creeks. Service was disrupted to less than a dozen customers for three days. This was the longest disruption of service and fortunately involved only a few patrons.

A moratorium remains in place regarding new turn-out deliveries. No new deliveries were added to the delivery system during 2007. One delivery was moved slightly to accommodate a property sale. The Measure 37 land use law approved by voters of the State of Oregon and upheld by the Oregon Supreme Court has not impacted the Irrigation District so far. Some lands served with District water have been approved for development by Washington County however no permanent water right transfers and or subdivisions within the District service area have been approved as of this time. The application process begins with Washington County and any changes in water service would have to then be approved by the District.

The Tualatin Valley Irrigation District and Clean Water Services continue their cooperative effort in identifying water use needs outside the District's boundaries. Water conservation continues to be a priority. The TVID water distribution network was again used by CWS with great success in 2007. Two temporary pipelines were run from a TVID turnout to augment the low summer and fall flows in McKay Creek. The water quality of the stream was improved greatly at minimal cost. The cooperative partnership is expected to continue and possibly expand to other creek crossings in the future.

Scoggins Dam

Scoggins Dam, the primary feature of the Tualatin Project, is located on Scoggins Creek, a tributary of the Tualatin River. Owned by the Federal Government, the dam is administrated under the Department of Interior, Bureau of Reclamation. The dam was constructed in the early 1970's for the purpose of storing water in the winter to make it available for use in the summer and fall. Half of the water stored in Henry Hagg Lake is authorized for irrigation to 17,000 acres. One fourth of the water is for municipal and industrial used primarily as a raw water drinking water source for the cities of Forest Grove, Hillsboro and Beaverton. The Lake Oswego Corporation also receives 500 additional acre feet for irrigation. The approximate final fourth of the stored water is for Clean Water Services. CWS has 16,900 acre feet contracted from the Project of which 12,618 acre feet is available from storage in normal operating years. CWS water is used to augment the low summer and fall Tualatin River stream flows. This helps meet water quality standards set for the River.

Scoggins Dam is also authorized by the U. S Congress to provide flood control for the communities located downstream. The dam controls runoff from a 39 square mile watershed or about 5% of the total 711 square miles in the entire Tualatin River basin. Flood control relief is provided for the cities of Gaston, Forest Grove, Cornelius and other downstream communities. By storing and providing water for these uses, the dam and lake also provide water for recreation, maintenance of fish life in the Tualatin River basin and conservation of wildlife resources. The reservoir (Henry Hagg Lake) is also a major recreational destination. In 2007, there were 684,184 user days recorded at the 2,851 acre facility. The Park and lake opened on March 3rd and closed November 18th. Recreational uses included boating, fishing, picnicking, swimming, hiking, biking and relaxation. Numerous races were also held throughout the year including triathlons. Scoggins Dam does not generate electricity.

A "milestone" was reached in the amount of stored water delivered from Scoggins Dam in 2007. This completed 33 years of storing and delivering water from the multi-use project. A total of 44,130 Acre Feet of water were delivered in 2007. This now brought the 33 year total to over one million acre feet. The final total was 1,013,928 acre feet. 22,114 AF was delivered to TVID (a new record high), 10,132 to CWS, 3,840 to the City of Hillsboro, 3,458 to the City of Forest Grove, 3,093 to the City of Beaverton, 499 to the Lake Oswego Corporation and 994 to other uses including golf courses. Regulation by the Oregon Water Resources Department from natural flow on the Tualatin River to storage began on June 13th and lasted until October 3rd. 2007 was a typical water use season.

At Scoggins Dam, earthquake activity, weather (including temperature and precipitation), river stage levels and the water surface elevation are reported and recorded electronically. Many of these electronic reporting stations have alarms to alert operators if sudden and or unusual conditions develop including earthquakes and flooding. Operation and Maintenance of the dam is managed under contract between the TVID and Reclamation. While operators are not on site 24/7, the Project is monitored 24/7, both by Reclamation and TVID personnel.

Security at Scoggins dam remains a priority. The Department of Homeland Security (DHS) uses a five level alert system. Reclamation's Advisory System and Response Measures require the Project to follow the DHS alert levels and are defined as follows:

Green alert	Low risk of terrorist attacks
Blue alert	General risk of terrorist attacks
Yellow alert	Significant risk of terrorist attacks
Orange alert	High risk of terrorist attacks
Red alert	Severe risk of terrorist attacks

The alert level remained at Yellow for all of 2007. When the alert level rises to Orange, the Dam and appurtenant structures are inspected thoroughly every day. Alert level elevations are not necessarily caused by a specific threat to Scoggins Dam. The threat may be national in scope or regional. Alerts are

now being based on the types of infrastructure deemed at risk. This has refined the necessity for all segments of government to respond to each threat. A Site Security Plan specific to Scoggins Dam, adopted in October 2005, is used to maintain a level of security on the Project for the protection of life and supply of water. The Plan documents existing security systems, procedures, security responses and responsibilities and is to be used in conjunction with numerous other documents relating to the safe operation of the Project. Site security is taken very seriously at Scoggins Dam.

2007 Events at Scoggins Dam

Pipe repair: In January, a major spot coating repair was done on the 64" diameter outlet works pipe. This consisted of preparing and coating areas where the coating had failed on the interior of the pipeline, the D/S face of the gate relief and the transition piping. A coatings contractor was given the task of washing the old coating and surface residue off, then preparing each site with needle guns before restoring the coating in prescribed stages. All rust nodules found were popped and removed. This project was inspected daily by TVID and Reclamation officials to assure proper procedures were followed. It was a stopgap project. The entire inner coating will have to be removed and recoated eventually, but this preventative maintenance project saved money and postponed a total repair for years.

Coho found: Seventeen coho redds were found in the Outlet Channel on Nov 21st, 2006. In an effort to save them and possibly reestablish a run in Scoggins Ck, restrictions in rate of flow change and the minimum required discharge were altered. Ramping of discharges was not mandatory but done voluntarily. The discharge also was never decreased to lower than 25 cfs, the flow in the creek when the redds were first observed. In November of 2007, new redds were found and the same ramping procedure is being used when possible in 2008. Of course, an emergency release for the safety of the dam and residents of the valley would supersede this procedure.

Title transfer: The title transfer process of the Tualatin Project and Scoggins Dam has come to being largely due to the Water Feasibility Study that has been ongoing for several years. It has been concluded that almost double the current storage is going to be needed in the Tualatin basin by the year 2050. A huge effort has been made to gain title to the Project to allow the dam to be raised. Local control would help in better managing the water with all entities involved.

Alarms installed: Intrusion Alarms installed in April and May continued to increase the security of the facility. These alarms have several different measuring devices included and are monitored 24/7 by a local monitoring service. All Mission Essential Vulnerable Areas (MEVA's) are now under continuous surveillance. This system augments the CCTV camera system that was updated two years ago. Several false alarms occurred in 2007 but no unauthorized intrusions occurred.

Oil spill response: Two responses to oil spills were made. One response was to "oil in the road" at the Stephein and Scoggins Valley road intersection, just above the lake. Oil was reported running into the ditch and then going immediately to the lake. Investigation found it to be water seeping up through the asphalt. Only trace amounts of oil from the asphalt were detected. In October, a diesel oil spill was reported in Gaston. It was minor and did not endanger waters of the Tualatin.

Tours: Numerous tours were again given to grade school classes from the West Metro area. Over 400 children grades 4 through 6 including teachers and chaperones, visited the Project. Each individual learned the purposes of Scoggins Dam/Henry Hagg Lake and its benefit to the Basin and community. These tours followed the release of fish fry which each classroom had cared for through the incubation process.

Procedure revisions: Standard Operating Procedure (SOP) revisions were made to the electrical section to depict all electrical changes that have been made over the last twenty years! Reclamation officials, the electrical contractor and site supervisor diligently recorded and then drew new schematics that accurately depict the changes. New buildings have been added, a new generator installed along with a multitude of other changes. These are now properly recorded.

Facility review: The 2007 Period Facility Review (PFR) of Scoggins Dam was performed in May. This is done every six years by a team of Reclamation officials from the Regional office in Boise, the Field office in Bend and the Dam operation personnel. It offsets the Comprehensive Facility Review (CFR) also performed every six years and last done in 2004. Investigation and inspections were made of the entire facility including the embankments, abutments, seepage drains, the outlet works and all operational activities. Any deficient areas are noted and then made in the form of recommendations to correct. The 2007 PFR report has not yet been issued.

Temperature probe installation: Final installation of a temperature probe at the gaging site at Dilley was done in May. This completes the system that measures the water temperature at Scoggins Ck. above the lake (inflow), Scoggins Ck below the dam (discharge), the gaging site at Gaston on the Tualatin River (before influence of Scoggins stored water) and now at Dilley on the Tualatin River after the two have been combined.

Topoff Emergency Management Terrorism Exercise: Scoggins Dam played in the exercise billed as the “largest emergency management exercise in history.” It was directed by the Federal government and directed locally by the Office of Consolidated Emergency Management. The exercise was multi-state and even included Guam. In the exercise, all Washington County jurisdictions were elevated to the Orange terrorism level. Scoggins dam played an extremely minor role when compared to the size of the entire scope. Communications were the primary area tested

Snow and flooding: Snow began falling on November 28th and by December 3rd, there was widespread flooding in the basin which even exceeded the Feb. 1996 levels in some areas. Inflow to the reservoir was 4600 cfs throughout the day. Many roads were closed, including Highway 47 south of Forest Grove between Gales Creek and the old railroad crossing. Huge amounts of sediment and debris were washed into the reservoir including large old growth trees and many alders complete with root wads. An estimated 5 to 7 acres of woody debris was collected in the lake. The reservoir stored all but minimum discharge during the flood since the fill season had just begun. The Tualatin River at Dilley (DLLO site) crested at 19.03'; this was only 0.03' lower than in 1996! Removal of the debris from the reservoir did not begin until February 2008.

Catch a Special Thrill: Catch A Special Thrill (CAST) continues to be a special event held on Sept 9th. Forty children ages 7-16 years old participated. The program is targeted for kids who have a variety of physical or developmental disabilities and in some cases, a terminal illness. Each child was given fishing gear, fun packs and a variety of goodies donated by the local community. There were 33 boats with 60 volunteers to make the day special, fun and memorable for the 40 children. Smiles and laughter in the face of difficulty is probably the best measure of success. Again, many fish were caught by excited youngsters. Partners and sponsors of the event included: Bureau of Reclamation, Oregon State BASS Federation, Oregon Bass and Panfish Club, Kiwanis Clubs–Forest Grove and Hillsboro, Washington County Parks, Gaston Fire and Rescue, Forest Grove Fire and Rescue, Eagle Claw Hooks, Plano Tackle Boxes, Tualatin Valley Irrigation District, FishingGear.com, and Zebco. The 2008 CAST event will be held on September 7th at “C” ramp. Anyone interested in participating or volunteering can contact Reclamation’s Lower Columbia Area Office at 503-872-2733. For a recap of the 2007 activities, including pictures, at Henry Hagg Lake, go to http://www.castforkids.org/2007_Events/cast_hagg.html

In conclusion, the 2007 water year was classified as normal in regards to both water available and water used. The Tualatin Project continues to be a vital asset for meeting the water needs of the Tualatin basin. A record of all daily operations of the dam and river flows both above the reservoir and below can be viewed in Appendix C under “Scoggins Dam Reservoir Operations.”

WATER QUALITY STATUS REPORT

BY JAN MILLER, CLEAN WATER SERVICES

Tualatin Basin TMDLs

The current Tualatin Total Maximum Daily Load (TMDL) became effective in August 2001. The Department of Environmental Quality revised the 1988 total phosphorus (for excessive algal growth and high pH) and ammonia (for low dissolved oxygen in the mainstem river) TMDLs and added TMDLs for temperature, bacteria, and settleable volatile solids which uses total suspended solids as a surrogate (for low dissolved oxygen in the tributaries). The Department of Environmental Quality issued Clean Water Services an NPDES Watershed-Based Waste Discharge Permit in February 2004. The following evaluation of river and tributary conditions and wastewater treatment plant effluent is for general information and not for determining compliance. In many instances, the statistics and reporting periods shown in this review are different than those used to judge compliance with the permits or to compare the river conditions to the TMDLs.

Total Phosphorus

The 2001 Tualatin TMDL set river and tributary loading capacities in mg/L. The following table shows the loading capacities and the data for the key sites both historically (1990, 1995, and 2000) and in recent years (2004 to 2007).

MEDIAN TOTAL PHOSPHORUS CONCENTRATIONS FOR SUMMER SEASON (MAY 1-OCT 31)

Location Code	Location	River Mile	2001 TMDL Loading Capacity (mg/L as P)	Total Phosphorus (mg/L as P)						
				1990	1995	2000	2004	2005	2006	2007

* Water quality data for the Tualatin River at Farmington was not available for the summer of 2005 due to bridge construction.

The following table shows the treatment plant performance relative to total phosphorus.

2007 MONTHLY MEDIAN TOTAL PHOSPHORUS CONCENTRATIONS IN WWTP EFFLUENT

		May (mg/L as P)	June (mg/L as P)	July (mg/L as P)	Aug (mg/L as P)	Sept (mg/L as P)	Oct (mg/L as P)
Rock Creek WWTP	Effluent	0.06	0.06	0.06	0.06	0.06	0.03
	Limit	0.10	0.10	0.10	0.10	0.10	0.10
Durham WWTP	Effluent	0.09	0.09	0.07	0.06	0.10	0.05
	Limit	0.11	0.11	0.11	0.11	0.11	0.11

The phosphorus TMDL was developed to protect the beneficial use of

- aesthetics, as measured by chlorophyll-*a*, and
- fish and wildlife, as measured by pH.

Three-month stratified mean chlorophyll-*a* for selected sites in the Tualatin Basin is shown in the following table. The water quality guidance level for this statistic is 15 µg/L. The river met the chlorophyll-*a* guidance level in 2007. This is the second year since the total phosphorus TMDL was issued in 1988 that it has met this guidance level.

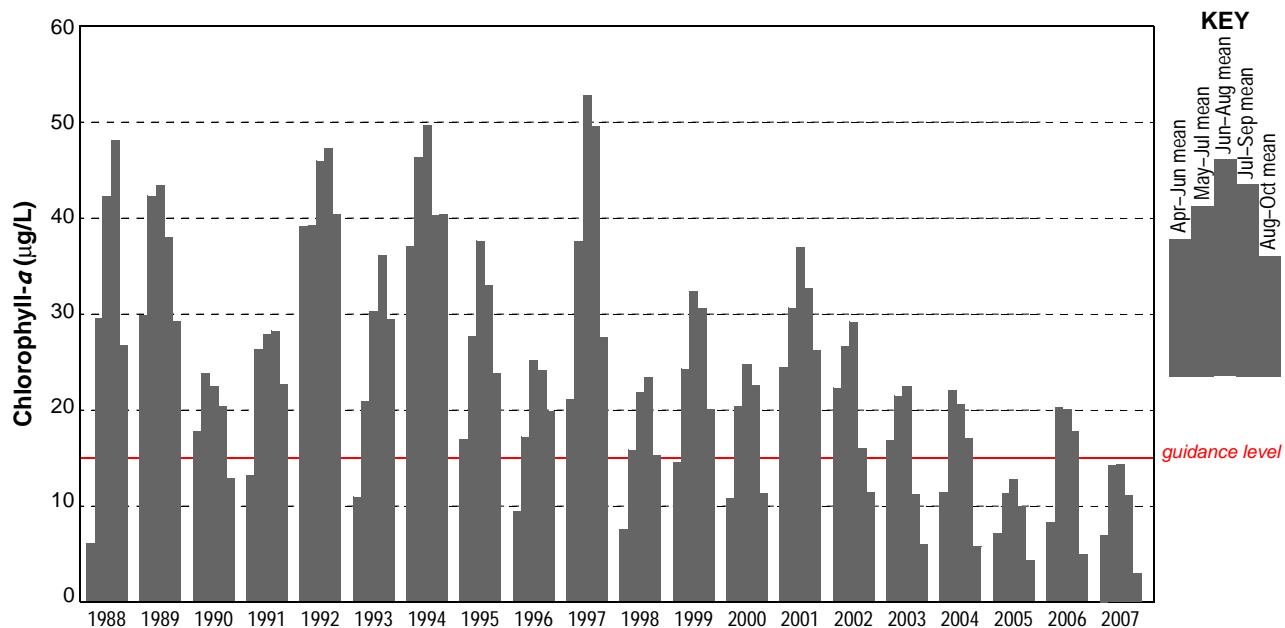

2007 THREE-MONTH MEAN CHLOROPHYLL-*a* CONCENTRATIONS

Location	River Mile	Mar–May (µg/L)	Apr–Jun (µg/L)	May–Jul (µg/L)	Jun–Aug (µg/L)	Jul–Sep (µg/L)	Aug–Oct (µg/L)
Tualatin River							
Rood Bridge Road	39.1	3.7	3.3	2.7	2.6	2.8	2.7
Farmington Road	33.3	3.6	2.9	2.2	1.8	1.7	1.7
Scholls	27.1	3.7	3.0	2.4	1.9	1.3	1.3
Elsner	16.5	4.4	4.8	5.4	5.2	3.6	2.2
Boones Ferry Road	8.7	4.4	7.6	10.8	10.3	6.3	2.2
Stafford Road	5.4	4.2	7.0	14.2	14.3	11.1	3.0

Chlorophyll-*a* concentrations are an indicator of the amount of algae in the river. High pH values can result from photosynthetic activities of the algae. This causes a negative impact on aquatic resources. The data from the continuous recorder at the Lake Oswego dam at river mile 3.4 were evaluated. This is the area of the river with the maximum algal production. In 2007, there were no pH values that exceeded 8.5. Low pH values are not a problem in the Tualatin River system.

The historic and current data for chlorophyll-*a* concentrations show an general decreasing trend over time (see the graph and table on the following page).

TUALATIN RIVER AT STAFFORD ROAD (RM 5.4)

MEAN CHLOROPHYLL- α CONCENTRATIONS – TUALATIN RIVER AT STAFFORD ROAD (RM 5.4)

Year	Apr-Jun (µg/L)	May-Jul (µg/L)	Jun-Aug (µg/L)	Jul-Sep (µg/L)	Aug-Oct (µg/L)
1988	6.1	29.6	42.2	48.1	26.7
1989	29.8	42.3	43.4	38.0	29.3
1990	17.8	23.8	22.4	20.4	12.8
1991	13.2	26.3	27.9	28.2	22.7
1992	39.1	39.2	45.9	47.3	40.3
1993	10.9	20.9	30.3	36.1	29.5

2003	16.8	21.5	22.4	11.2	6.0
2004	11.4	22.0	20.6	17.0	5.8
2005	7.1	11.3	12.7	10.0	4.4
2006	8.3	20.3	20.1	17.8	5.0
2007	7.0	14.2	14.3	11.1	3.0

Ammonia TMDL

The 2001 TMDL revised the permitted ammonia loads. It allows higher loads of ammonia in the spring and early summer when river conditions are favorable for the assimilation of ammonia and lower ammonia loads in the fall when sediment oxygen demand consumes more oxygen leaving very little assimilative capacity. For the months of July through November, there are two tiers of ammonia limits. The applicable tier is based on the previous weeks downstream dissolved oxygen levels. The ammonia limit ends when Farmington flow exceeds 350 cfs. Flows were above 350 cfs on November 14, 2007.

The following table compares the effluent ammonia load with the most restrictive ammonia limit (most restrictive tier). A less restrictive limit would be in place if dissolved oxygen levels downstream of the treatment plants were above 6.7 mg/L. The actual permit is based on weekly ammonia discharges. There were no weekly permit violations in 2007.

2007 MONTHLY AMMONIA LOADS AND LIMITS FOR WWTP EFFLUENT

	May	June	July	August	Sept	October
Rock Creek WWTP median load (lb/day)	13	5	6	5	6	6
Durham WWTP median load (lb/day)	43	21	5	5	6	6
Total allowed load (lb/day)	2566	1683	832	296	218	258

The ammonia TMDL is designed to protect the dissolved oxygen levels in the reservoir-like section of the Tualatin River. The water quality criteria for this section of the river, which is considered “Cool Water Habitat,” are.

- Grab samples: DO > 6.5 mg/L
- Continuous Monitoring:
 - 30-day average of daily mean DO > 6.5 mg/L (no credit for supersaturation)
 - 7-day average of daily minimum DO > 5.0 mg/L (no credit for supersaturation)
 - Daily minimum DO > 4.0 mg/L

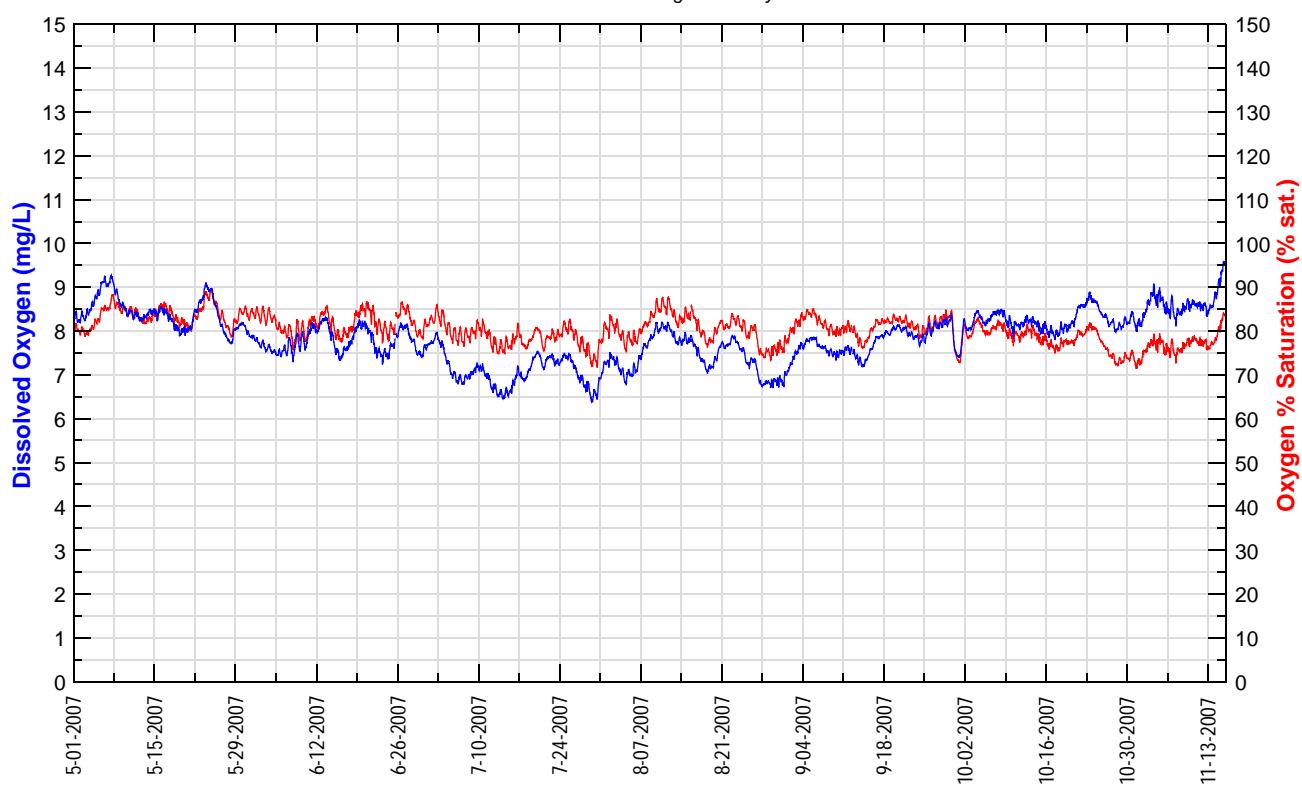

The following table shows the river conditions relative to dissolved oxygen at two locations in the reservoir section of the river. Continuous monitors are deployed at these locations. Graphs of the dissolved oxygen concentrations at these two locations are shown on the following page.

NUMBER OF DAYS THAT DID NOT MEET DISSOLVED OXYGEN CRITERIA IN 2007

Criterion	May	June	July	Aug	Sept	Oct	Summer Percentage
Tualatin River at RM 24.5							
30 day	0	0	0	0	0	0	0 %
7 day	0	0	0	0	0	0	0 %
Daily	0	0	0	0	0	0	0 %
Tualatin River at Oswego Dam							
30 day	0	0	0	20	23	0	18%
7 day	0	0	3	0	0	0	1 %
Daily	0	0	0	0	0	0	0 %

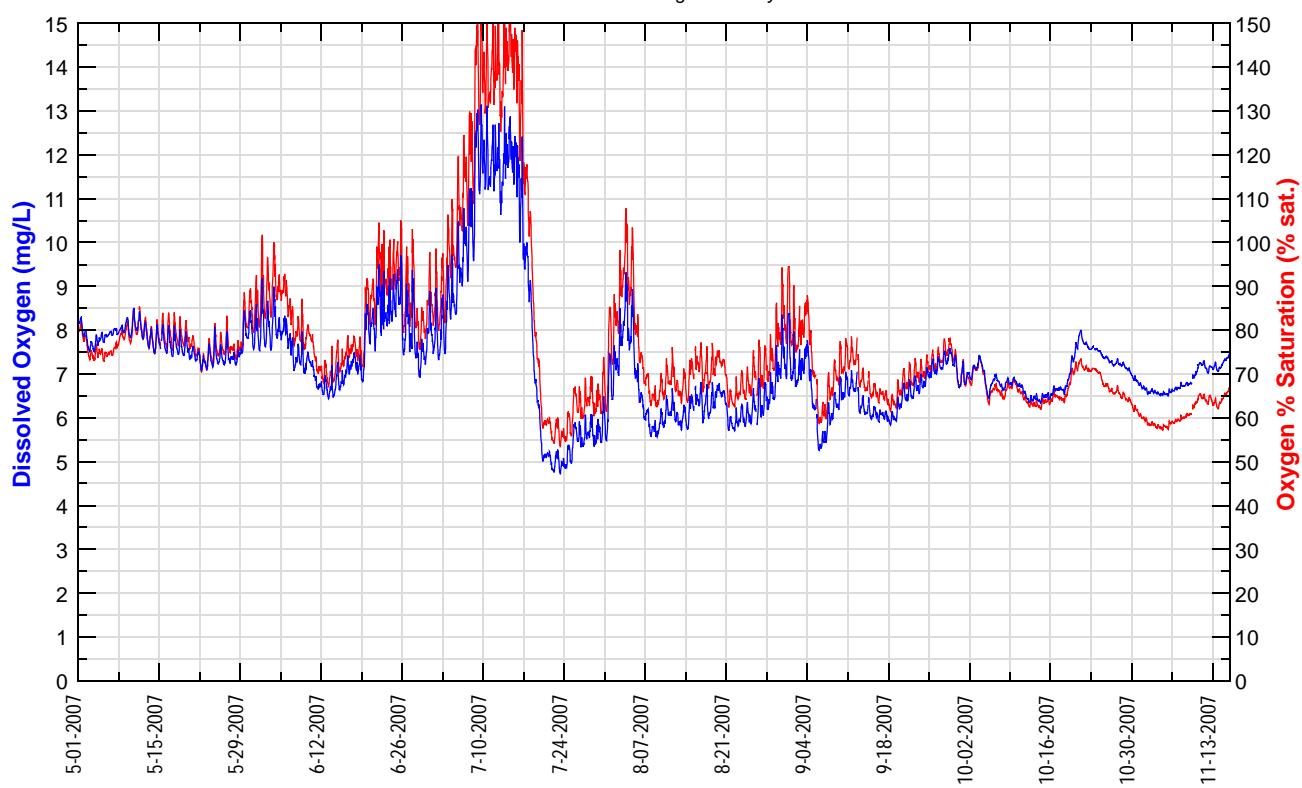

Tualatin River at River Mile 24.5 (14206694)

Data from U.S. Geological Survey

Tualatin River at Oswego Diversion Dam (14207200)

Data from U.S. Geological Survey

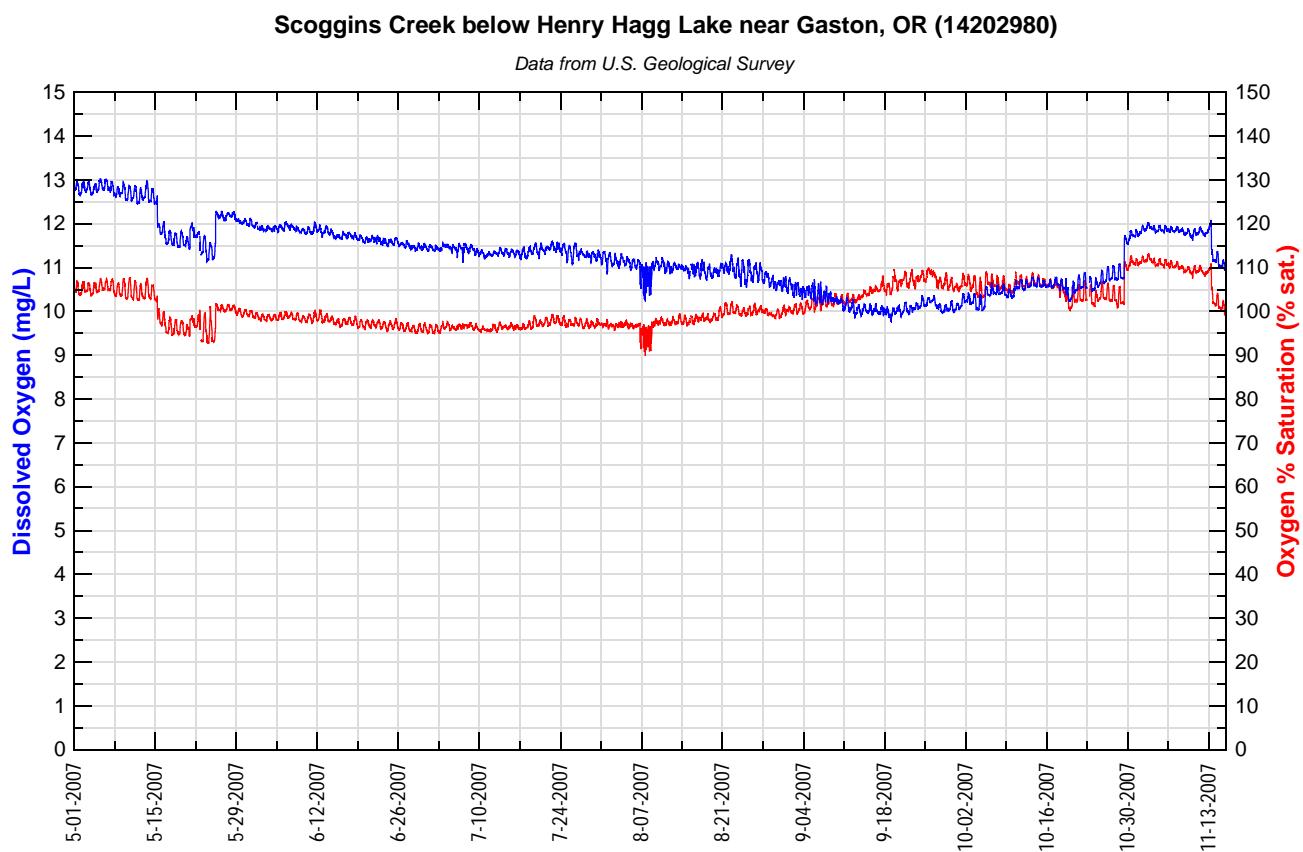

Temperature TMDL

Temperature data for the Tualatin River and its tributaries are shown in Appendix F.

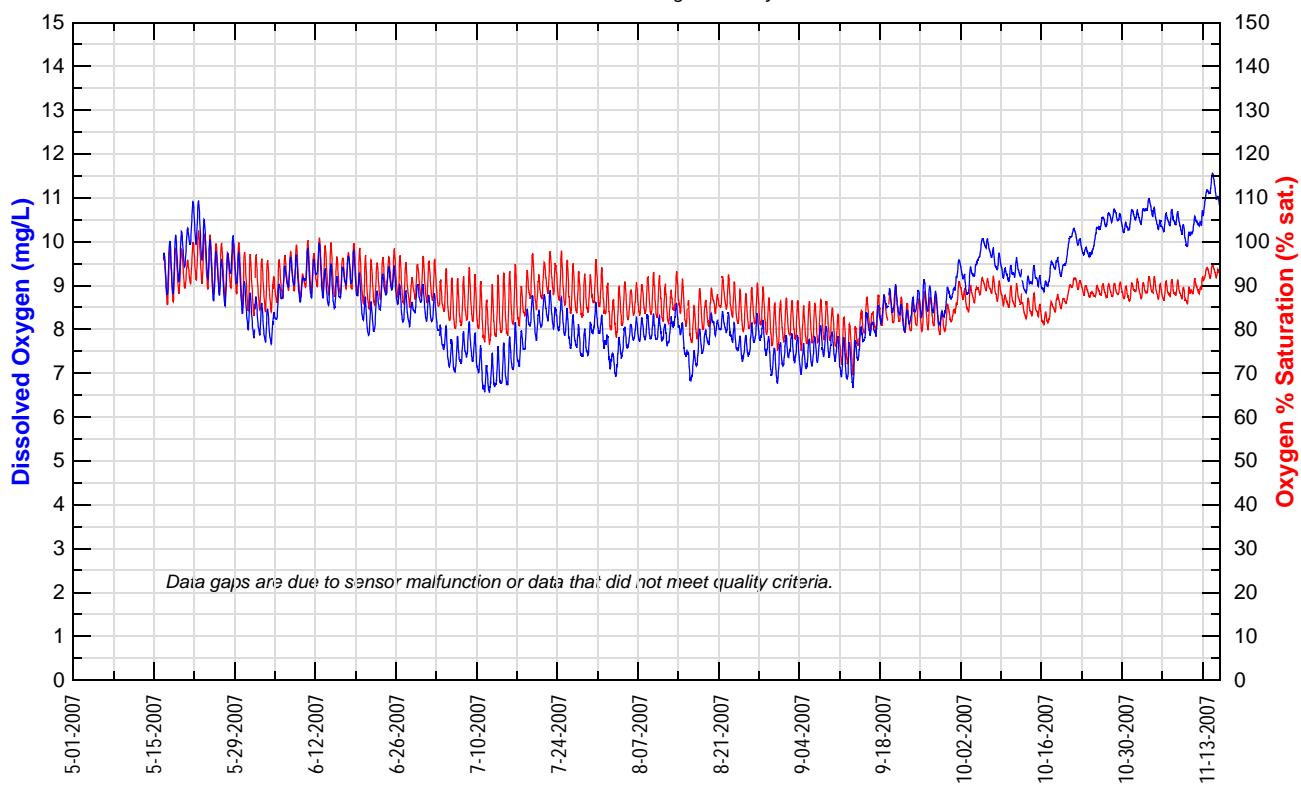

Dissolved Oxygen TMDL for Tributaries

The 2001 Tualatin TMDL contained requirements for tributary total suspended solids (a surrogate for settleable volatile solids) load reductions to protect dissolved oxygen. The best way to display data concerning solids reduction are being developed. The following graphs show the dissolved oxygen levels measured by continuous monitors at several tributaries during the summer period. These data are available at http://or.water.usgs.gov/cgi-bin/grapher/graph_setup.pl?basin_id=tualatin.

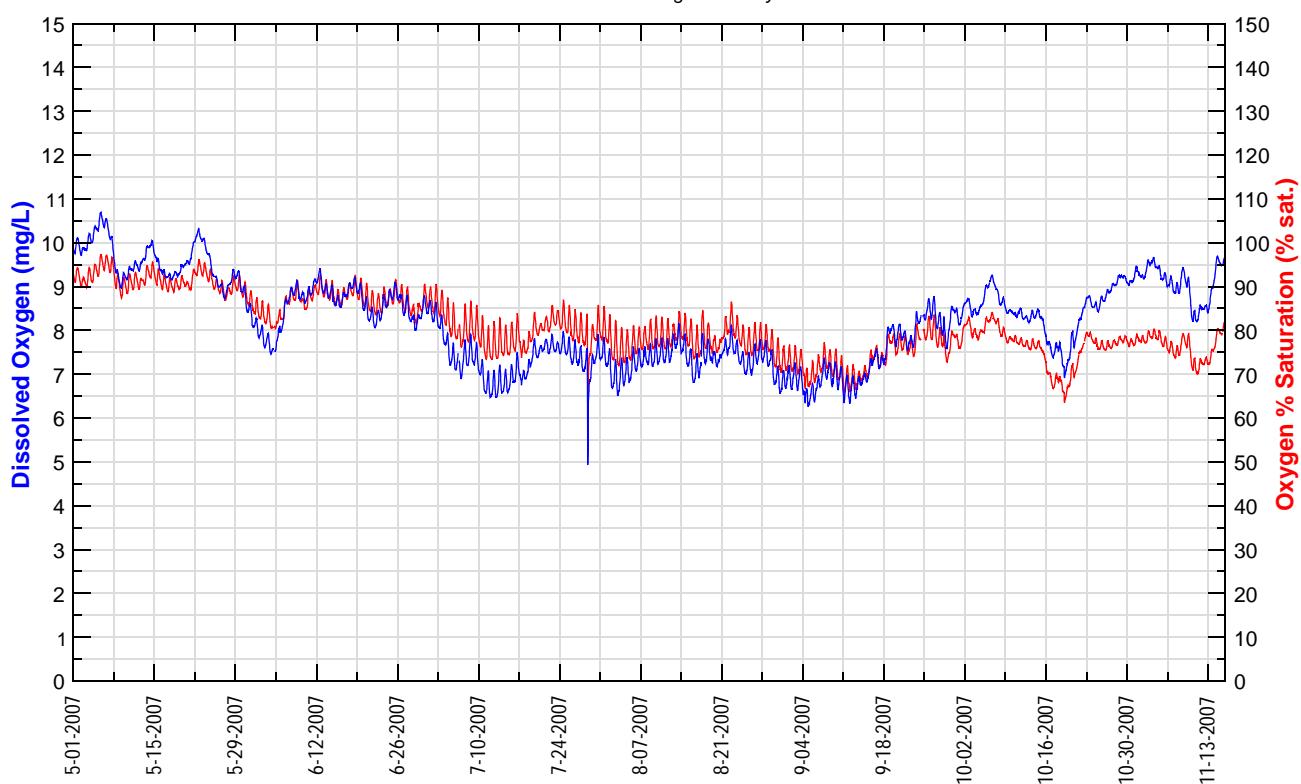

Gales Creek at Old Hwy 47, Forest Grove, OR (453040123065201)

Data from U.S. Geological Survey

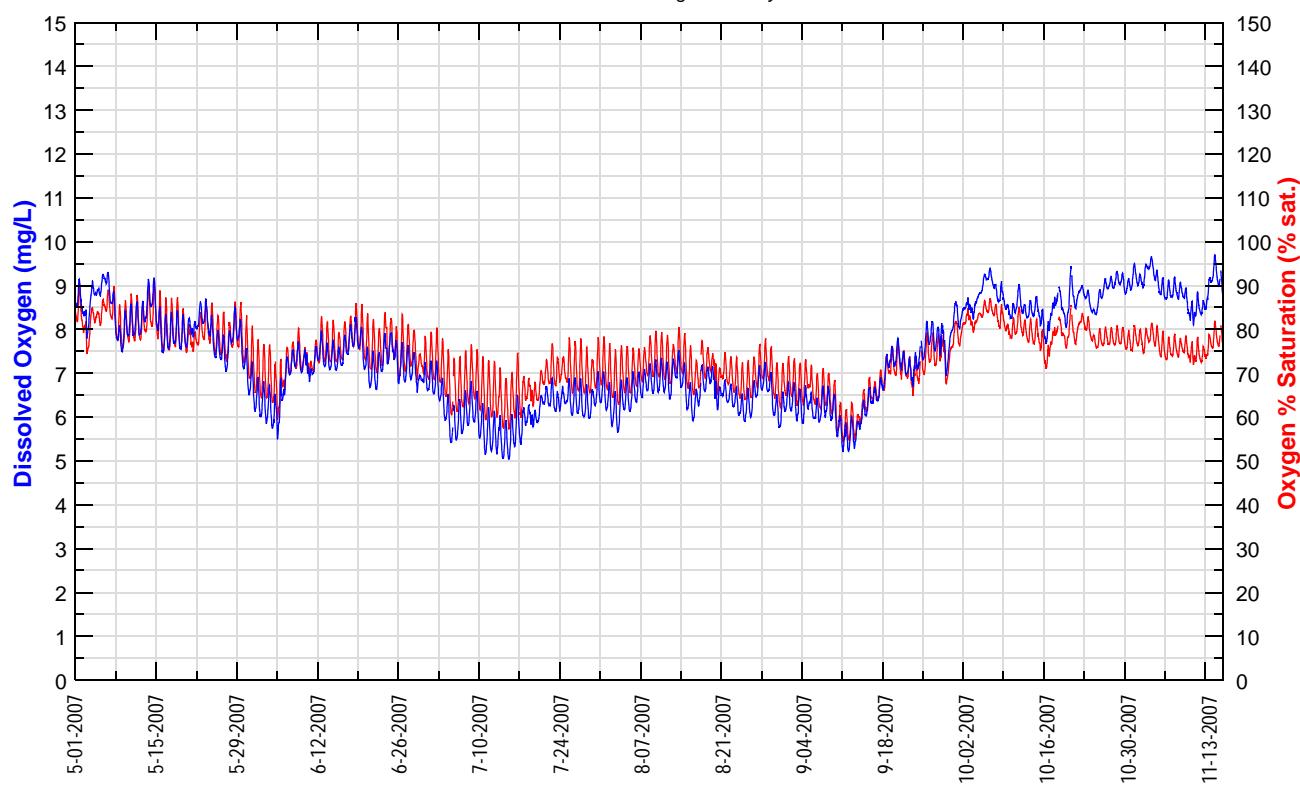

Dairy Creek at Hwy 8, Hillsboro, OR (453113123003501)

Data from U.S. Geological Survey

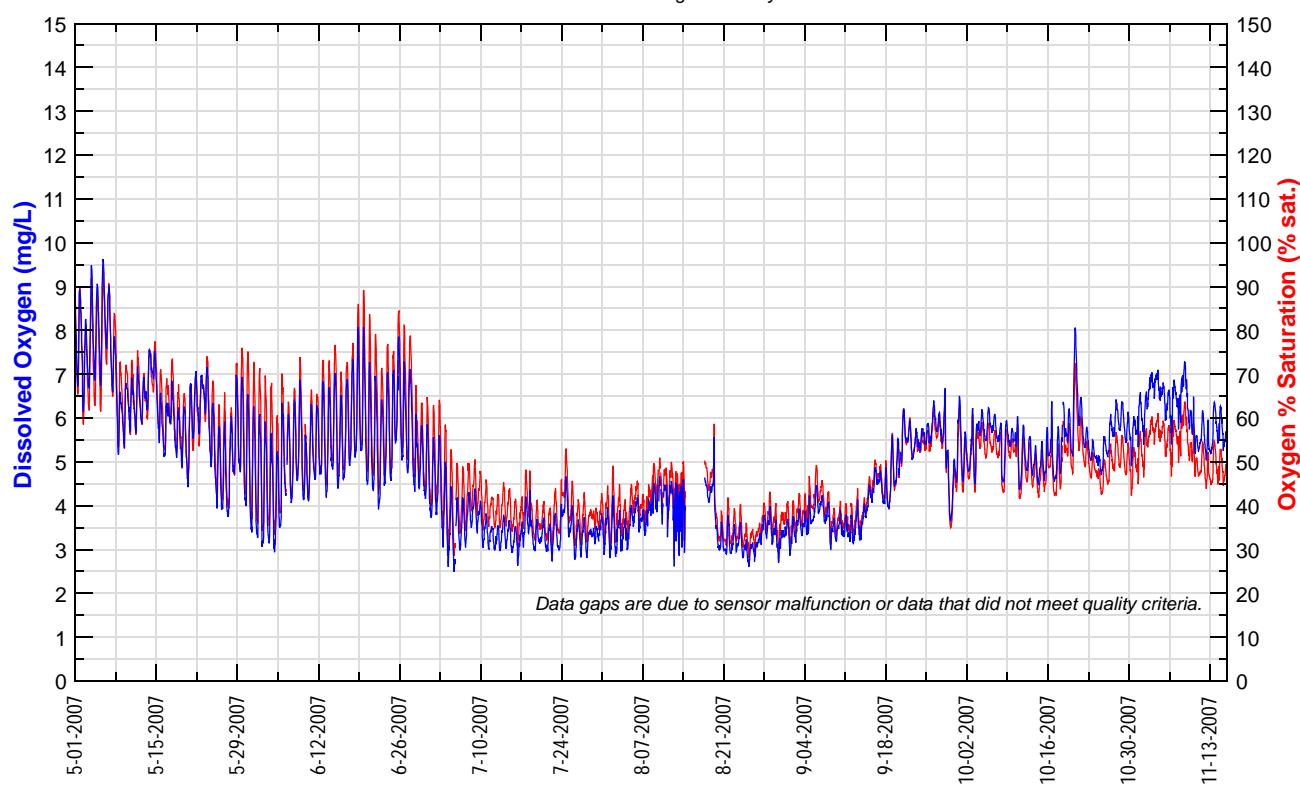

Rock Creek at Brookwood Ave, Hillsboro, OR (453030122560101)

Data from U.S. Geological Survey

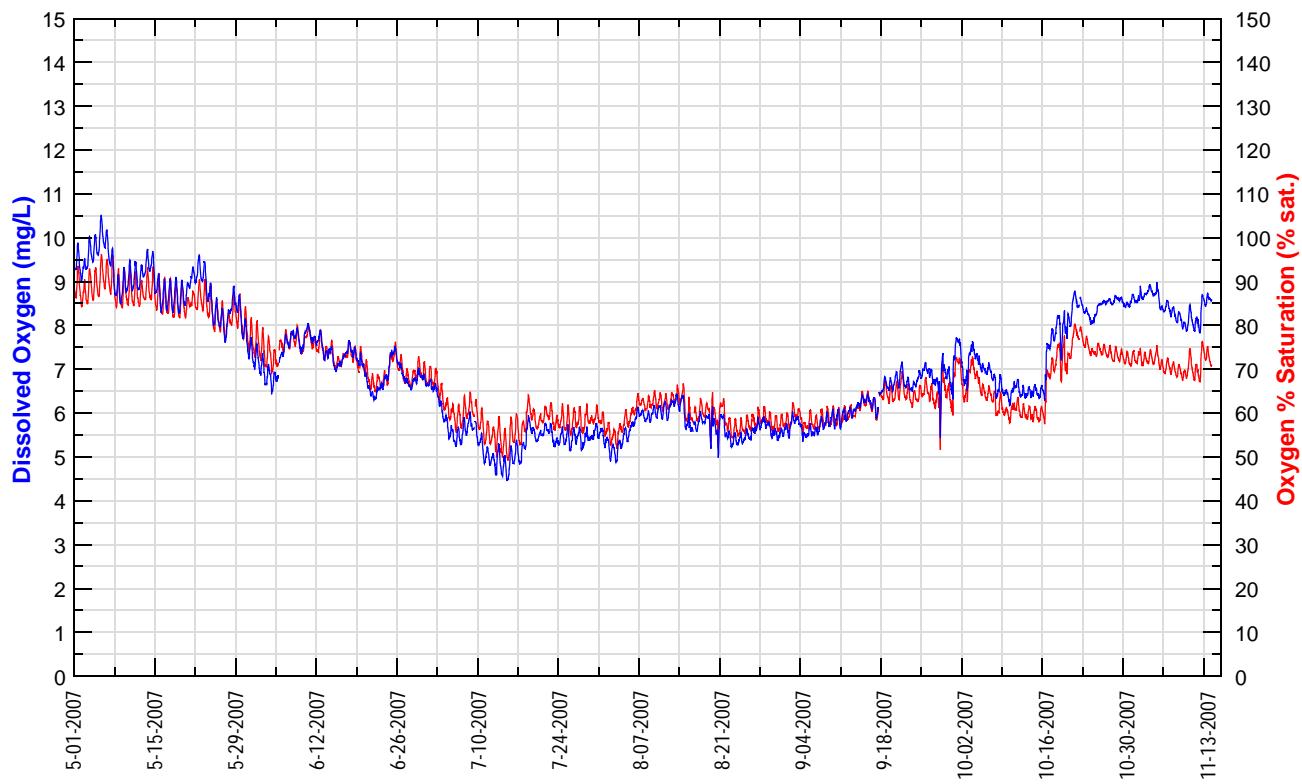

Beaverton Creek at 170th Ave, Beaverton, OR (453004122510301)

Data from U.S. Geological Survey

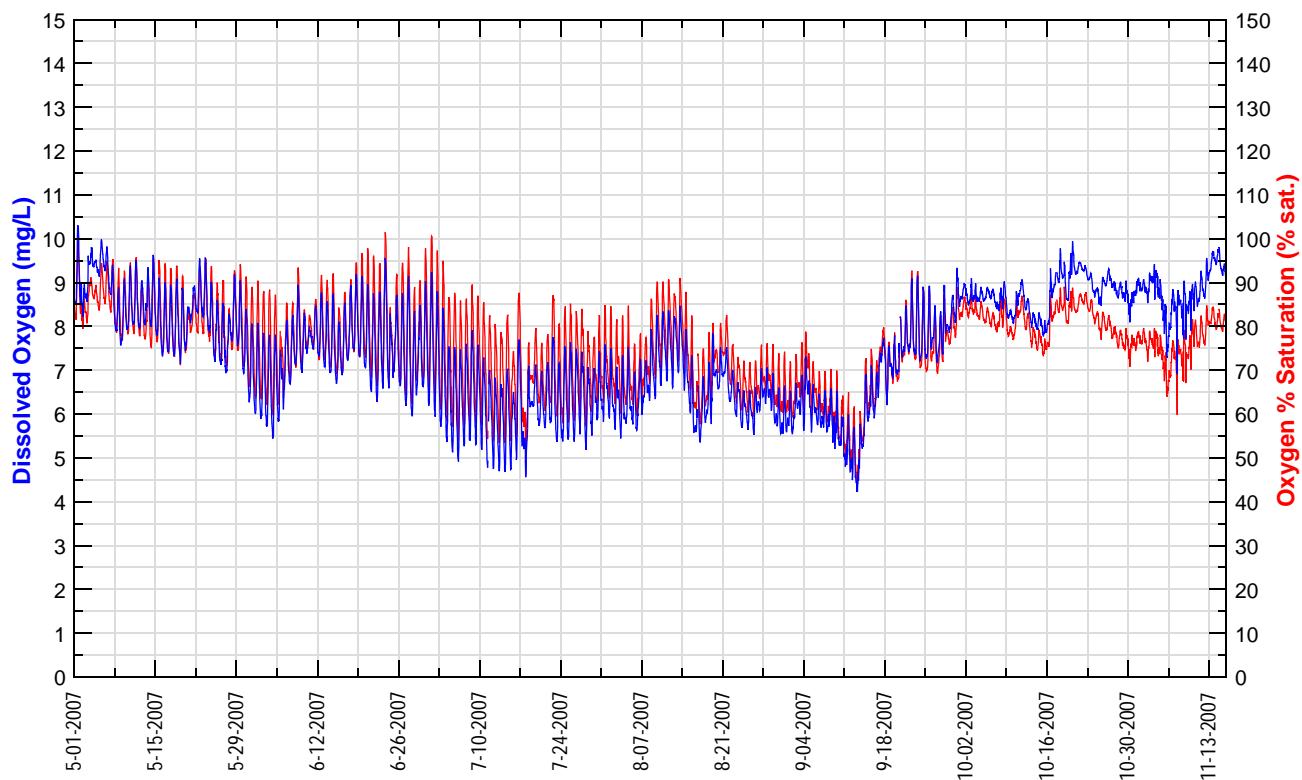

Chicken Creek at Scholls-Sherwood Hwy, Sherwood, OR (452230122512201)

Data from U.S. Geological Survey

Fanno Creek at Durham Road (14206950)

Data from U.S. Geological Survey

Bacteria TMDL

The TMDL for bacteria applies to both the Tualatin River and its tributaries during both summer and winter. The table below shows median and 90th-percentile bacteria levels for the 2007 winter and summer seasons. The median is the middle value—half of the measured values were less than the median and half were greater. Similarly, the 90th percentile also divides the data—90% of the measured values were less and 10% were greater. The water quality goals are the same for summer and winter; they are:

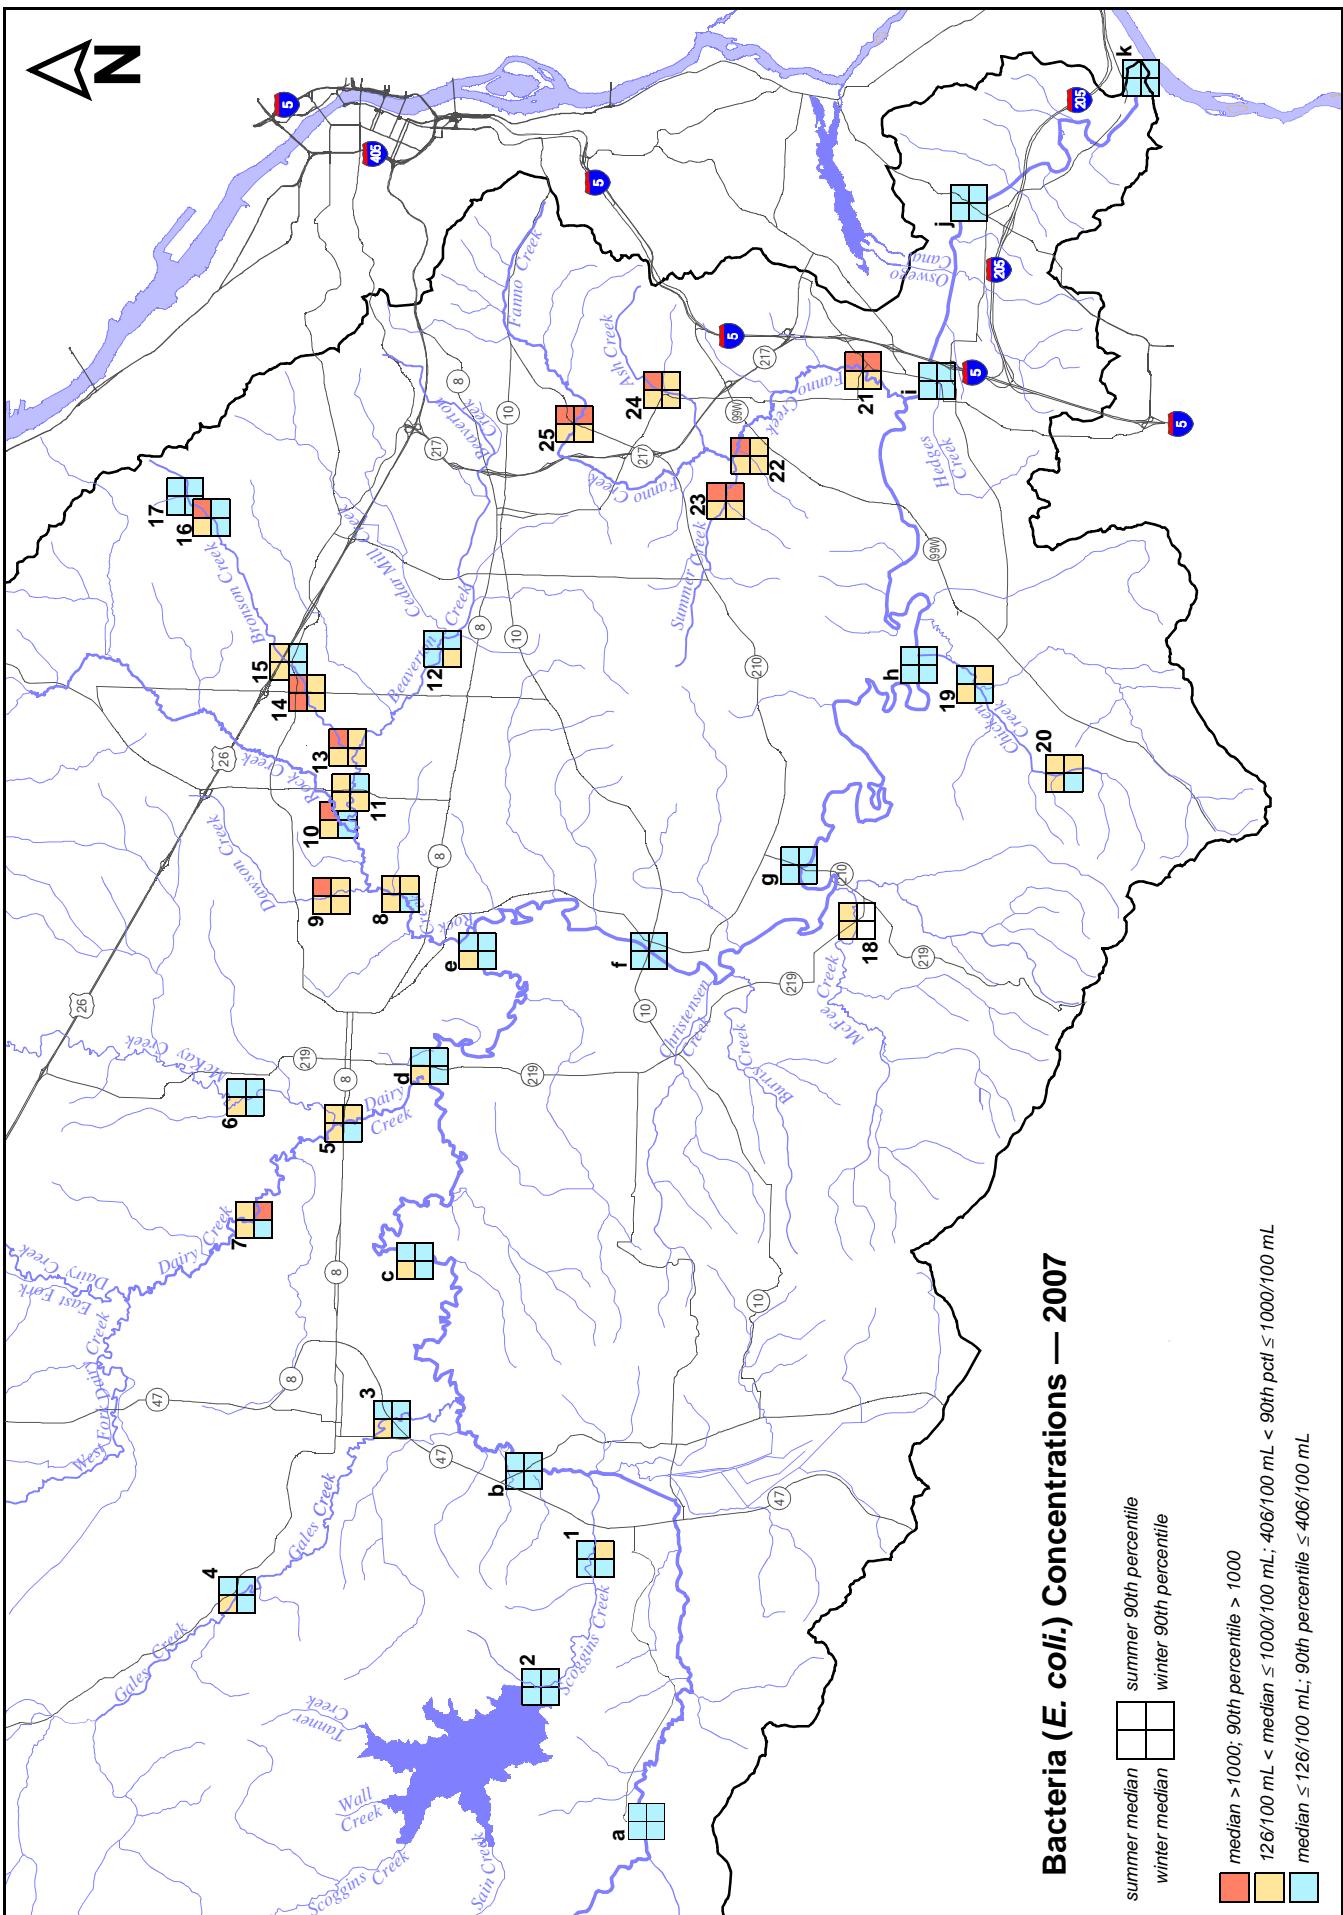

- median concentration of no more than 126 colony forming units/100 mL (#/100 mL)
- 90th percentile concentration of no more than 406/100 mL.

A map comparing the values to water quality goals is shown on the following page.

90TH PERCENTILES OF E.COLI CONCENTRATIONS FOR 2007

Map Code	Location Code	Location	River Mile	Winter (Nov-06 – Apr-07) (#/100 mL)*		Summer (May-07 – Oct-07) (#/100 mL)*

Appendix B

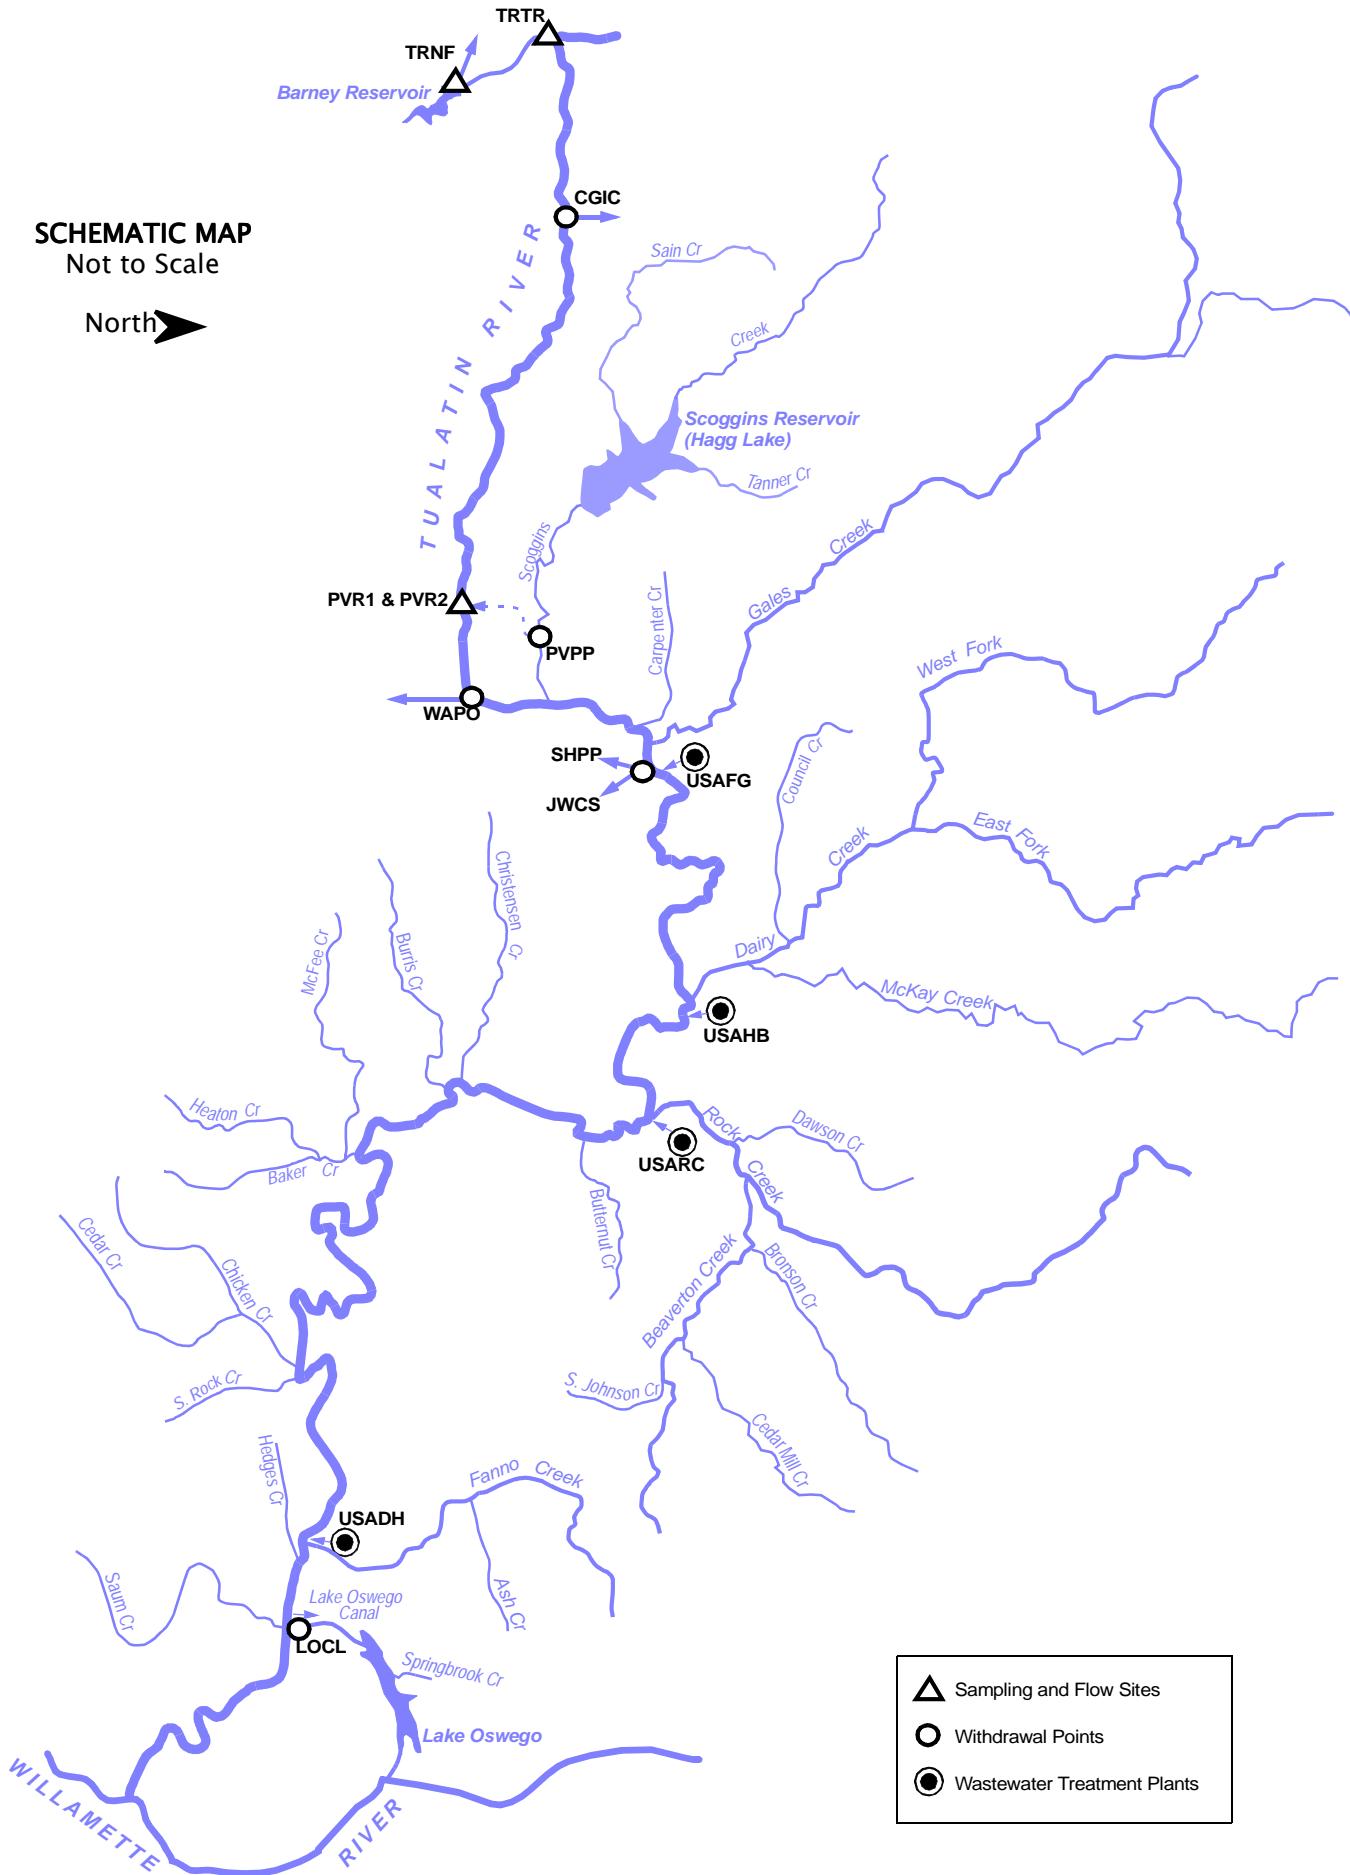

Selected Releases and Withdrawals

The following information is for selected water releases to and withdrawals from the Tualatin River and its tributaries. It is not a comprehensive listing of releases and withdrawals. Some of the data represent daily mean flows and some represent instantaneous measurements. All streamflow measurements are in Appendix A.

STREAM TEMPERATURE SITES — ALPHABETICAL LISTING BY SITE CODE

SITE CODE	SITE NAME	RIVER MILE	STATION ID	PAGE
4550	Gales Creek above Glenwood, Oregon	19.9	14204550	F-10
ASMP	Ash Creek at Metzger Park at Metzger, Oregon	1.25	14206933	F-53
B170	Beaverton Creek at 170th Ave, Beaverton, Oregon	4.9	—	F-35
BCBR	Bronson Creek at Bronson Road near Orenco, Oregon	2.1	14206423	F-39
BCCH	Beaverton Creek at Cedar Hills Blvd at Beaverton, Oregon	7.45	14206360	F-31
BCHH	Burris Creek at Hwy 219	0.38	—	F-45
BCSR	Bronson Creek at Saltzman Road near Orenco, Oregon	5.1	14206419	F-38
BVTS	Beaverton Creek at NE Guston Court near Orenco, Oregon	1.2	14206435	F-40
CCER	Cedar Creek at Edy Road near Sherwood, Oregon	0.62	14206748	F-50
CCKR	Chicken Creek at Kruger Road	4.5	—	F-49
CCSR	Chicken Creek at Scholls-Sherwood Road	2.3	14206750	F-51
CMMB	Cedar Mill Creek at Murray Boulevard near Beaverton, Oregon	1.64	14206395	F-34
DAIRY	Dairy Creek at Hwy 8 near Hillsboro, Oregon	2.06	14206200	F-25
DCBR	Dawson Creek at Brookwood Road near Hillsboro, Oregon	0.7	14206443	F-41
DCSR	Dairy Creek at Susbauer Road	6.02	—	F-19
DLLO	Tualatin River at Dilley, Oregon	58.8	14203500	F-9
ECMR	Erickson Creek at Menlo Drive at Beaverton, Oregon	0.76	14206365	F-32
EFDD	East Fork Dairy Creek near Dairy Creek Road near Mountaintdale, Oregon	12.33	14205480	F-17
EFDR	East Fork Dairy Creek at Roy Road	1.24	—	F-18
ELSN	Tualatin River at Elsner Road near Sherwood, Oregon	16.2	14206600	F-48
FANO	Fanno Creek at Durham Road near Tigard, Oregon	1.2	14206950	F-55
FRMO	Tualatin River at Farmington, Oregon	33.3	14206500	F-44
GALES	Gales Creek at Old Hwy 47 near Forest Grove, Oregon	2.36	14204530	F-13
GASO	Tualatin River at Gaston, Oregon	62.3	14202510	F-5
GCCH	Gales Creek at Clapshaw Hill Road near Gales Creek, Oregon	12.36	14204540	F-11
GCSR	Gales Creek at Stringtown Road	6.98	—	F-12
HCTP	Hedges Creek at Tualatin Community Park at Tualatin, Oregon	0.3	14206958	F-56
JCDV	Johnson Creek at Davis Road near Beaverton, Oregon	1.3	14206372	F-33
LOCS	Tualatin River at Oswego Canal near Lake Oswego, Oregon	6.7	14206990	F-59
MCKH	McKay Creek at Hornecker Road near Hillsboro, Oregon	2.2	14206180	F-23
MCKN	McKay Creek at Northrup Road near North Plains, Oregon	15.5	14205980	F-20
MCKP	McKay Creek at Padgett Road	1.31	14206190	F-24
MCFE	McFee Creek at Hwy 219 near Scholls, Oregon	0.8	14206670	F-46
MCSC	McKay Creek at Scotch Church Road above Waible Ck near North Plains, Oregon	6.3	14206070	F-21
NEAL	Tualatin River at RM 24.5 near Scholls, Oregon	24.5	14206694	F-47
ODAM	Tualatin River at Oswego Dam near West Linn, Oregon	3.4	14207200	F-60
RCQR	Rock Creek at Quatama near Orenco, Oregon	4.9	14206347	F-30
RCBR	Rock Creek at Brookwood Avenue, Hillsboro, Oregon	2.4	—	F-42
RCRR	Rock Creek at Rock Creek Road near Bowers Junction, Oregon	15.8	14206305	F-28
RCTV	Rock Creek at Hwy 8 near Hillsboro, Oregon	1.2	14206450	F-43
RCWU	Rock Creek at West Union Road near Bethany, Oregon	9.0	14206338	F-29
ROOD	Tualatin River at Rood Bridge Road near Hillsboro, Oregon	38.4	14206295	F-27
SC121	Summer Creek at 121st Avenue near Tigard, Oregon	1.0	14206938	F-54
SCBR	Saum Creek at Borland Road	0.6	—	F-58
SCHO	Sain Creek above Henry Hagg Lake near Gaston, Oregon	1.6	14202920	F-7
SCLO	Scoggins Creek above Henry Hagg Lake near Gaston, Oregon	8.0	14202850	F-6
SCOO	Scoggins Creek below Henry Hagg Lake near Gaston, Oregon	4.80	14202980	F-8
SCRL	Sylvan Creek at Raleighwood Lane near West Slope, Oregon	1.0	14206905	F-52
SPBR	Springbrook Creek at Iron Mountain Road near Lake Oswego, Oregon	0.18	14211116	F-62
TRGC	Tualatin River at Golf Course Road near Cornelius, Oregon	51.5	14204800	F-14
TRJB	Tualatin River at Hwy 219 Bridge	44.4	14206241	F-26
TRLF	Tualatin River below Lee Falls near Cherry Grove, Oregon	70.7	14202450	F-4
TRT	Tualatin River at Tualatin, Oregon	8.9	14206956	F-57
WC143	Willow Creek at 143rd Avenue near Beaverton, Oregon	3.5	14206410	F-36
WCHP	Willow Creek at Heritage Parkway near Beaverton, Oregon	0.75	14206413	F-37
WCJS	Waible Creek at Jackson School Road near Hillsboro, Oregon	1.0	14206100	F-22
WFDE	West Fork Dairy Creek at Evers Road	1.96	14205160	F-16
WFDM	West Fork Dairy Creek at Manning, Oregon	12.9	—	F-15
WSLO	Tualatin River at West Linn	1.75	14207500	F-61

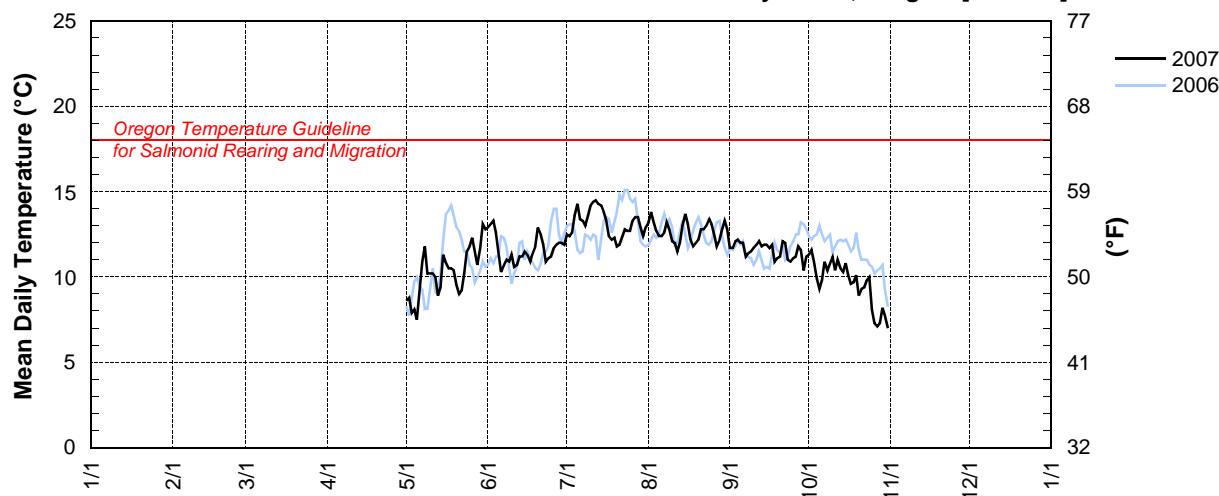

TRLF – 14202450 – TUALATIN RIVER BELOW LEE FALLS NEAR CHERRY GROVE, OREGON [RM 70.7]

Hagg Lake Monitoring 2007 Data

The following data are provisional and have not been fully reviewed or edited.

HAGG LAKE MONITORING PROGRAM 2007 — DATA LIST

DATA TABLE	PAGE
<i>Hagg Lake Tributaries</i>	
Benthic Invertebrate Index of Biological Integrity (BIBI)	G-3
Benthic community indicators of biological condition	G-3
Benthic invertebrate density	G-4
<i>Hagg Lake monitoring was discontinued in 2007 for the following:</i>	
Petroleum hydrocarbons	
Physical and chemical data, including field data	
Bacteriological data	
Phytoplankton density and biovolume	
Zooplankton density and zooplankton length frequency	
<i>Hagg Lake tributary monitoring for the following was discontinued in 2007:</i>	
Physical and chemical data, including field data	
Bacteriological data	

HAGG LAKE MONITORING 2007 — BENTHIC INVERTEBRATE INDEX OF BIOLOGICAL INTEGRITY

[Metric code: a '+' indicates metric value generally decreases with declining biological integrity; a '-' indicates metric value generally increases with declining biological integrity. Condition categories: L= low, M=medium, H=high. Sample collected 10/5/2007.]

Metric	Sain Creek		Scoggins Ck		Tanner Ck	
	Value	Score	Value	Score	Value	Score
+ Total number of taxa	41	5	42	5	33	3
+ Number of <i>Ephemeroptera</i> taxa	6	3	8	3	8	3
+ Number of <i>Plecoptera</i> taxa	5	3	6	3	3	1
+ Number of <i>Tricoptera</i> taxa	5	3	4	1	2	1
+ Number of long-lived taxa	5	5	5	5	2	1
+ Number of intolerant taxa	0	1	2	1	1	1
- Percent tolerant taxa	45.49	3	21.85	3	68.91	1
+ Percent predator	5.2	1	8.32	1	2.52	1
+ Number of clinger taxa	22	5	23	5	19	3
- Percent Dominance (3 taxa)	57.64	3	53.85	3	76.47	1
BIBI TOTAL SCORE	32		30		16	
BIOLOGICAL CONDITION CATEGORY	M		M		L	

Categories based on comparison with unimpacted Puget Lowland and Willamette Valley streams. Scores indicate: 1-low, 3-moderate, 3-high. Maximum IBI score=50. BIBI scores: 0-24=L, 25-39=M, >40=H. Based on average/summation of 3 replicates, not on each individual replicate. Riffle habitat. D-Frame net; 5 point composite sample; total area= 1 square meter; 500 micron mesh; 500 organism subsample minimum. Based on single composite sample.

HAGG LAKE MONITORING 2007 — BENTHIC COMMUNITY INDICATORS OF BIOLOGICAL CONDITION

[Metric code: a '+' indicates metric value generally decreases with declining biological integrity; a '-' indicates metric value generally increases with declining biological integrity. Condition: L= low, M=medium, H=high. Sample collected 10/5/2007.]

Metric	Sain Creek		Scoggins Ck		Tanner Ck	
	Value	Condition	Value	Condition	Value	Condition
+ Total abundance (number/m ²)	288	L	325	L	357	L
+ EPT taxa richness	16	L	18	L	13	L
+ Predator richness	8	L	9	L	6	L
+ Scraper richness	9	L	11	M	11	M
+ Shredder richness	3	L	5	M	2	L
+ Percent intolerant taxa	0	L	0.62	L	0.28	L
- Hilsenhoff Biotic Index	5.5	L	4.66	L	5.71	L
- Percent <i>Baetis tricaudatus</i>	44.79	L	17.23	M	65.55	L
- Percent collector	77.07	L	58.49	L	86.55	L
- Percent Parasite	2.77	H	1.85	H	0.28	H
- Percent <i>Oligochaeta</i>	0.69	H	1.23	M	1.68	M
- Number of tolerant taxa	3	M	6	M	3	M
- Percent <i>Simuliidae</i>	7.64	M	13.54	L	2.24	H
- Percent <i>Chironomidae</i>	19.1	M	24.62	M	13.17	M

Condition based on comparisons with a Pacific Northwest montane stream with high biological integrity. (A montane is the biome characterized by moist cool upland slopes below timberline and dominated by large coniferous trees.)
